ETR0342-005

### 30mA High Speed LDO Regulator

#### ■GENERAL DESCRIPTION

The XC6225 series is a high accuracy, low noise, and low dropout CMOS LDO regulator. The series includes a reference voltage source, an error amplifier, a driver transistor, a current limiter, and a phase compensation circuit. The CE function enables the entire circuit to be turned off by a low level input signal to the CE pin. In this stand-by state, the XC6225B series can discharge the electric charge stored at the output capacitor through the internal auto-discharge switch, and as a result the VOUT pin quickly returns to the VSS level. The output stabilization capacitor (CL) is also compatible with low ESR ceramic capacitors. Output voltage is selectable in 0.05V increments within a range of 0.8V~5.0V. The current limit fold-back circuit works as a short circuit protection as well as the output current limiter. The series achieves a fast response with only 25 µ A of low power consumption. The current limit is set to 50mA (TYP.) so that the device is optimized to protect the circuit from over-current. It is ideally suited for applications requiring 30 mA or less.

A small USP-4 package makes high density mounting possible.

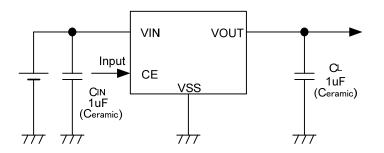

#### APPLICATIONS

- Smart phones / Mobile phones
- Portable games
- Digital still cameras / Camcorders
- Digital audio equipment
- Mobile devices / terminals

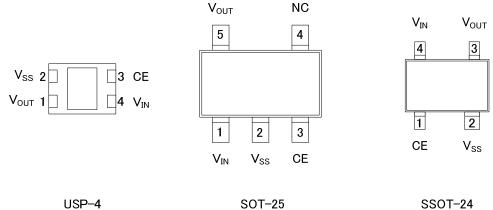

### ■FEATURES

| Output Current                          | : 30mA <50mA (TYP.) Limit>      |
|---|---------------------------------|
| Dropout Voltage                         | : 70mV@ IOUT=30mA, VOUT=3.2V    |
| Operating Voltage Range                 | : 2.5V ~ 6.0V                   |
| Output Voltage Range                    | : 0.8V~5.0V (0.05V increments)  |
| Accuracy                                | : <u>+</u> 2% (Vou⊤≥1.5V)       |
|   | <u>+</u> 0.03V (Vouт≦1.45V)     |
| Low Power Consumption                   | : 25 μ A (TYP.)                 |
| Stand-by Current                        | : Less than 0.1 $\mu$ A         |
|   |                                 |
| High Ripple Rejection                   | : 70dB @ 1kHz                   |
| Operating Ambient                       | : -40°C~+85°C                   |
| Temperature                             |                                 |
| Output Capacitor                        | : 1.0 $\mu$ F ceramic capacitor |
| C <sub>L</sub> High-Speed Auto-Discharg | je (XC6225B)                    |
| Low Output Noise                        |                                 |
| Packages                                | : USP-4, SOT-25                 |
|   | SSOT-24                         |
| Environmentally Friendly                | : EU RoHS Compliant, Pb Free    |
| • •                                     |                                 |

### ■TYPICAL APPLICATION CIRCUIT

### ■ PIN CONFIGURATION

(TOP VIEW)

SSOT-24 (TOP VIEW)

\*The heat sink pad of the USP-4 is reference to be soldered to enhance the strength. Please refer to the reference mount pattern and metal mask pattern. This pad should be electrically opened or connected to the Vss (No.2) pin.

### ■ PIN ASSIGNMENT

(BOTTOM VIEW)

|       | PIN NUMBER |         | PIN NAME         | FUNCTIONS      |
|-------|------------|---------|------------------|----------------|
| USP-4 | SOT-25     | SSOT-24 |                  | FUNCTIONS      |
| 4     | 1          | 4       | V <sub>IN</sub>  | Power Input    |
| 1     | 5          | 3       | V <sub>OUT</sub> | Output         |
| 2     | 2          | 2       | V <sub>SS</sub>  | Ground         |
| 3     | 3          | 1       | CE               | ON/OFF Control |
| -     | 4          | -       | NC               | No Connection  |

## ■ PIN FUNCTION ASSIGNMENT

| PIN NAME | SIGNAL | STATUS          |
|----------|--------|-----------------|
|          | L      | Operation OFF   |
| CE       | Н      | Operation ON    |
|          | OPEN   | Undefined state |

\*CE pin should not be left open. Each should have a certain voltage.

## ■PRODUCT CLASSIFICATION

Ta=25°C

NOTE:

\* 1: Unless otherwise stated regarding input voltage conditions,  $1.5V \le V_{OUT(T)} \le 5.0V$  is  $V_{IN} = V_{OUT(T)} + 1.0V$ , and  $0.8V \le V_{OUT(T)} \le 1.45V$  is  $V_{IN} = 2.5V$ .

\* 2: VOUT (E) = Effective output voltage (Refer to the voltage chart)

(I.e. the output voltage when stabilized "VOUT (T) +1.0V" is provided at the VIN pin while maintaining a certain IOUT value.)

\* 3: VOUT (T) = Nominal output voltage

\* 4: Vdif ={VIN1<sup>(\*6)</sup>-VOUT1<sup>(\*5)</sup>}

\* 5: Vout1=A voltage equal to 98% of the output voltage when an amply stabilized Vout(t) + 1.0V is input.

\* 6: VIN1= The input voltage when VOUT1 appears at the V<sub>OUT</sub> pin while input voltage is gradually decreased.

\* 7: For the XC6225 series type B only. The XC6225 series type A discharges by using the two resistors R1 and R2 shown in the block diagram.

\* 8: Limit current is defined as the output current when  $V_{OUT(E)} \times 0.95$  is impressed at the  $V_{OUT}$  pin.

\* 9: The device may not satisfy the specification values when it is used with the input voltages lower than the conditions of ILIM3.

### ■ OPERATIONAL EXPLANATION

The voltage divided by resistors R1 & R2 is compared with the internal reference voltage by the error amplifier. The P-channel MOSFET connected to the Vout pin, is then driven by the subsequent control signal. The output voltage at the Vout pin is controlled and stabilized by a system of negative feedback. The current limit circuit and short-circuit protection circuit operate in relation to the level of output current. Further, the IC's entire circuitry is turned off by the input signal to the CE pin.

#### BLOCK DIAGRAM

<Input and Output Capacitors>

The XC6225 needs an output capacitor  $C_L$  for phase compensation. Values required for the phase compensation are shown in the chart below. If a loss of the capacitance happens, the stable phase compensation may not be obtained. Please ensure to use a capacitor which does not depend on bias or temperature too much. For a stable power input, please connect an input capacitor  $C_{IN}$  of  $1.0 \,\mu$  F between the  $V_{IN}$  pin and the  $V_{SS}$  pin.

| OUTPUT VOLTAGE | OUTPUT CAPACITOR           |
|----------------|----------------------------|
| 0.8V~1.15V     | More than $C_L=4.7  \mu$ F |
| 1.2V~1.35V     | More than $C_L=2.2 \mu$ F  |
| 1.4V~4.0V      | More than $C_L=1.0  \mu$ F |
| 4.05V~5.0V     | More than $C_L=2.2  \mu$ F |

<CL Auto-Discharge Function>

XC6225 series Type B can discharge the electric charge in the output capacitor (CL), when a low signal to the CE pin, which enables the whole IC circuit to be turned off, is inputted via the N-channel transistor and C<sub>L</sub> discharge resistance(R<sub>DCHG</sub>) located between the Vout pin and the Vss pin (refer to BLOCK DIAGRAM). The C<sub>L</sub> auto-discharge resistance value is set at 780  $\Omega$  (Vout=4.0V @ VIN=6.0V at TYP.). The discharge time of the output capacitor (CL) is set by the C<sub>L</sub> auto-discharge resistance (R<sub>DCHG</sub>) value [R<sub>DCHG</sub>] and the output capacitor (CL). By setting the time constant of the CL auto-discharge resistance(R<sub>DCHG</sub>) value [R<sub>DCHG</sub>] and the output capacitor value (CL) as  $\tau$  ( $\tau$  =C x R<sub>DCHG</sub>), the output voltage after discharge via is calculated by the following formula.

 $V = V_{OUT(E)} \times e^{-t/\tau}$  or  $t = \tau \ln(V/V_{OUT(E)}/V)$ 

 $\label{eq:Viewer} \begin{array}{l} Where \\ V: \mbox{ Output voltage after discharge } \\ V_{\mbox{Out}(E)}: \mbox{ Output voltage } \\ t: \mbox{ Discharge time,} \\ \hline \tau: \mbox{ C}_L \mbox{ auto-discharge resistance } R_{\mbox{DCHG}} \times \mbox{ Output capacitor } (\mbox{ C}_L) \mbox{ value } \mbox{ C} \end{array}$ 

### OPERATIONAL EXPLANATION (Continued)

#### <Current Limiter, Short-Circuit Protection>

The XC6225 series' fold-back circuit operates as an output current limiter and a short protection circuit for the output pin. When the load current reaches the current limit level, the fixed current limiter circuit operates and output voltage drops. When the output pin is short-circuited to the Vss pin, the current falls and reaches about 15mA.

#### <CE Pin>

The IC's internal circuitry can be shutdown via the signal from the CE pin with the XC6225 series. In the shutdown state, output at the VOUT pin will be pulled down to the Vss level via R1 & R2. However, with the XC6225 series type B, the  $C_L$  auto-discharge ( $R_{DCHG}$ ) N-channel transistor switch is connected in parallel to R1 and R2 while the power supply is applied to the  $V_{IN}$  pin.

The output voltage is in an undefined state when the CE pin is left open. If this IC is used with the correct voltage for the CE pin, the logic is fixed and the IC will operate normally. However, the supply current may increase as a result of shoot-through current in the IC's internal circuitry when a medium voltage is input.

### ■NOTES ON USE

1. For temporary, transitional voltage drop or voltage rising phenomenon, the IC is liable to malfunction should the ratings be exceeded.

2. Where wiring impedance is high, operations may become unstable due to noise and/or phase lag depending on output current. Please strengthen  $V_{IN}$  and  $V_{SS}$  wiring in particular

3. Please wire the input capacitor ( $C_{IN}$ ) and the output capacitor ( $C_L$ ) as close to the IC as possible.

4. Capacitances of these capacitors ( $C_{IN}$ ,  $C_L$ ) are decreased by the influences of bias voltage and ambient temperature. Care shall be

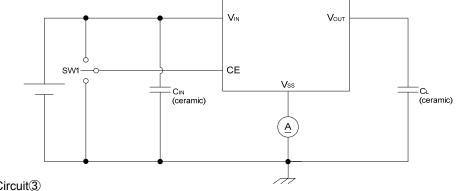

taken for capacitor selection to ensure stability of phase compensation from the point of ESR influence.

5. When it is used in a quite small input / output dropout voltage, output may go into unstable operation. Please test it thoroughly before using it in production.

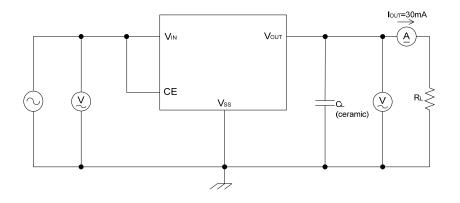

6. Torex places an importance on improving our products and their reliability.

We request that users incorporate fail-safe designs and post-aging protection treatment when using Torex products in their systems.

| 4    | 3.95               | 4.3  | 4.65 | 5.0  |  |  |
| 5    | 4.0                | 4.35 | 4.7  | -    |  |  |
| 6    | 4.05               | 4.4  | 4.75 | -    |  |  |

3 (4) represents production lot number

01 to 09, 0A to 0Z, 11 to 9Z, A1 to A9, AA to Z9, ZA to ZZ in order. (G, I, J, O, Q, W excluded. No character inversion used.)

- 1. The products and product specifications contained herein are subject to change without notice to improve performance characteristics. Consult us, or our representatives before use, to confirm that the information in this datasheet is up to date.
- 2. We assume no responsibility for any infringement of patents, patent rights, or other rights arising from the use of any information and circuitry in this datasheet.
- 3. Please ensure suitable shipping controls (including fail-safe designs and aging protection) are in force for equipment employing products listed in this datasheet.
- 4. The products in this datasheet are not developed, designed, or approved for use with such equipment whose failure of malfunction can be reasonably expected to directly endanger the life of, or cause significant injury to, the user.

(e.g. Atomic energy; aerospace; transport; combustion and associated safety equipment thereof.)

- Please use the products listed in this datasheet within the specified ranges.
   Should you wish to use the products under conditions exceeding the specifications, please consult us or our representatives.
- 6. We assume no responsibility for damage or loss due to abnormal use.
- 7. All rights reserved. No part of this datasheet may be copied or reproduced without the prior permission of TOREX SEMICONDUCTOR LTD.
