

150mA Small Dual LDO Regulator with ON/OFF Switch

GENERAL DESCRIPTION

The XC6420 series is a small dual CMOS LDO regulator with 2-channel 150mA outputs. The series features high speed, high accuracy, high ripple rejection and low dropout voltage. The series is capable of high density board installation by the small package of two low on-resistance regulators. Each output voltage is internally set in a range from 1.2V to 3.6V in increments of 0.05V with $\pm 2\%$ accuracy.

The EN function controls the two regulators on/off independently. In the stand-by mode, the electric charge at the output capacitor C_L is discharged via the internal switch and as a result the V_{OUT} pin quickly returns to the V_{SS} level.

The series is also compatible with low ESR ceramic capacitors. The high level of output stability is maintained even during frequent load fluctuations, due to the excellent transient response performance. The two regulators are completely isolated so that a cross talk during load fluctuations is minimized.

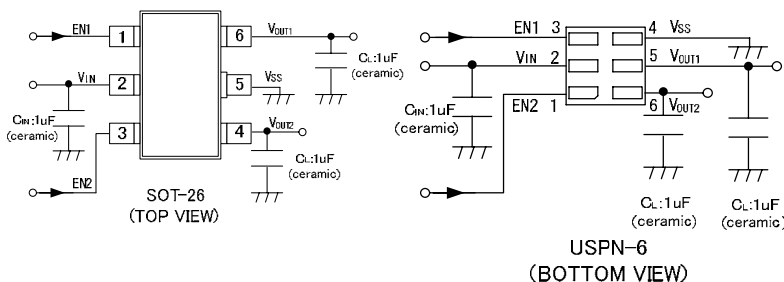

APPLICATIONS

- Smart phones / Mobile phones
- Portable game consoles
- Digital audio equipments
- Digital still cameras / Camcorders

FEATURES

Maximum Output Current	: 150mA
Operating Voltage Range	: 1.6V ~ 5.5V
Output Voltage	: 1.2V ~ 3.6V ($\pm 2\%$) 0.05V increments
Dropout Voltage	: 190mV @ $I_{OUT}=150mA$ ($V_{OUT}=3.3V$)
Low Power Consumption	: 55 μA / ch (TYP.)
Stand-by Current	: 0.1 μA
Ripple Rejection	: 75dB@1kHz
EN Function	: Active High
	C_L High Speed Auto Discharge
Protection Circuit	: Current Limit 250mA (TYP.) Short Circuit 50mA (TYP.)
Output Capacitor	: 1.0 μF Ceramic Capacitor
Operating Ambient Temperature	: -40 ~ +85
Packages	: SOT-26 USPN-6 USP-6B04
Environmentally Friendly	: EU RoHS Compliant, Pb Free

OPERATIONAL EXPLANATION

The voltage divided by resistors Rx1 & Rx2 is compared with the internal reference voltage by the error amplifier. The P-channel MOSFET connected to the V_{OUT} pin is then driven by the subsequent output signal. The output voltage at the V_{OUT} pin is controlled & stabilized by a system of negative feedback. The current limit circuit and short protect circuit operate in relation to the level of output current. Further, the IC's internal circuitry can be shutdown via the EN pin's signal.

<Low ESR Capacitor>

The XC6420 needs an output capacitor (C_L) for phase compensation. In order to ensure the effectiveness of the phase compensation, we suggest that an output capacitor (C_L) is connected as close as possible to the output pin (V_{OUT}) and the V_{SS} pin. Please use an output capacitor with a capacitance value of at least 1.0 μF. Also, please place 1.0 μF input capacitor C_L between V_{IN} and V_{SS} pins for stabilizing input supply voltage.

<Current Limiter, Short-Circuit Protection>

The XC6420 includes a combination of a fixed current limiter circuit & a foldback circuit, which aid the operations of the current limiter and circuit protection. When the load current reaches the current limit level, the fixed current limiter circuit operates and output voltage drops. As a result of this drop in output voltage, the foldback circuit operates, output voltage drops further and output current decreases. When the output pin is shorted, a current of about 50mA flows.

<EN Pin>

The IC's internal circuitry can be shutdown via the signal from the EN pin with the XC6420 series. In shutdown mode, the series enables the electric charge at the output capacitor C_L to be discharged via the internal switch between V_{OUT} pin and V_{SS} pin, and as a result the V_{OUT} pin quickly returns to the V_{SS} level.

The EN pin is internally pulled down by a resistor. Please note that input current through a pull-down resistor exists.

<C_L Auto-Discharge Function>

XC6420 series can quickly discharge the electric charge at the output capacitor (C_L), when a low signal to the EN pin, which enables a whole IC circuit put into OFF state, is inputted via the N-channel transistor located between the V_{OUT} pin and the V_{SS} pin (cf. BLOCK DIAGRAM). The C_L discharge resistance is set to 300 Ω when V_{IN} is 5.5V (TYP.) and V_{OUT} is 2.0V (TYP.). Moreover, discharge time of the output capacitor (C_L) is set by the C_L auto-discharge resistance and the output capacitor (C_L). By setting time constant of a C_L auto-discharge resistance value [R_{DCHG}] and an output capacitor value (C_L) as τ = C × R, the output voltage after discharge via the N channel transistor is calculated by the following formulas.

$$V = V_{OUT(E)} \times e^{-t/\tau}, \text{ or } t = \tau \ln(V_{OUT(E)} / V)$$

V : Output voltage after discharge, V_{OUT(E)} : Output voltage, t: Discharge time,
τ : C_L auto-discharge resistance R_{DCHG} × Output capacitor (C_L) value C

NOTES ON USE

1. For temporary, transitional voltage drop or voltage rising phenomenon, the IC is liable to malfunction should the ratings be exceeded.
2. Torex places an importance on improving our products and its reliability. However, by any possibility, we would request user fail-safe design and post-aging treatment on system or equipment.
3. Where wiring impedance is high, operations may become unstable due to the noise and/or phase lag depending on output current. Please strengthen V_{IN} and V_{SS} wiring in particular.
4. Please wire the input capacitor (C_{IN}) and the output capacitor (C_L) as short and close to the IC as possible.
