

Features

- VOLTAGE OFFSET: $\pm 100\mu\text{V}$ (MAX)
- WIDE COMMON MODE VOLTAGE: **3.0V to +76V**
- SUPPLY VOLTAGE: **3.0V to +5.5V**
- ACCURACY and ZERO-DRIFT PERFORMANCE
 - ◆ $\pm 0.5\%$ Gain Error (Max over temperature)
 - ◆ $0.4\mu\text{V}/^\circ\text{C}$ Offset Drift (Max, $-40^\circ\text{C} \sim 125^\circ\text{C}$)
 - ◆ $10\text{ppm}/^\circ\text{C}$ Gain Drift (Max)
- THREE GAIN OPTIONS for VOLTAGE OUTPUT
 - ◆ TPA1285T: 20V/V
 - ◆ TPA1285F: 50V/V
 - ◆ TPA1285H: 100V/V
- Rail-to-Rail Output
- Industrial -40°C to 125°C Operation Range
- ESD Rating: Robust 2.5kV – HBM, 1.5kV – CDM

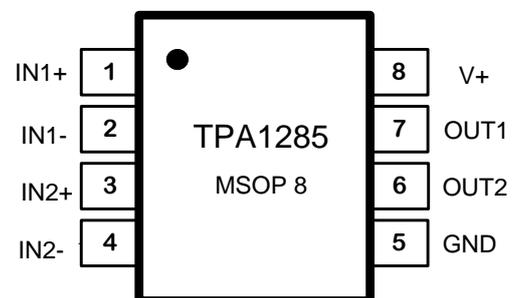

Applications

- CURRENT SENSING (High-Side)
- BATTERY CHARGERS
- POWER MANAGEMENT
- AUTOMOTIVE
- SERVER BACKPLANES
- BASE STATIONS & TELECOM EQUIPMENT
- INDUSTRIAL CONTROL AND AUTOMATION

Functional Block Diagram

Pin Configuration

Description

The TPA1285, high precision, high common voltage, 2 channel high-side current sense amplifier has very high precision accuracy specifications of V_{os} less than $100\mu\text{V}$ (max) and gain error less than 0.5% (max). Three fixed gains are available: 20V/V, 50V/V, and 100V/V. The low offset of the zero-drift architecture enables current sensing with maximum drops across the shunt as low as 5mV full-scale.

The TPA1285 features an input common-mode voltage range from 3.0V to 76V with 80kHz of small-signal bandwidth, which makes it ideal for small signal conditioning interfacing with a SAR ADC.

The TPA1285 offers breakthrough performance throughout the -40°C to $+125^\circ\text{C}$ temperature range. It features a zero-drift core, which leads to a maximum offset drift of $0.4\mu\text{V}/^\circ\text{C}$ throughout the operating temperature range and the common-mode voltage range. The TPA1285 is offered 8-pin MSOP package

Absolute Maximum Ratings ^{Note 2}

| | | | |
|---|-------------|--|----------------|
| Supply Voltage | 6V | Current at Supply Pins..... | ±60mA |
| Input Common Voltage (Continuous)..... | 3.0 to 80V | Operating Temperature Range..... | -40°C to 125°C |
| Input Common Voltage (Survival)..... | 3.0 to 100V | Maximum Junction Temperature..... | 150°C |
| Input Current: +IN, -IN ^{Note 3} | ±20mA | Storage Temperature Range..... | -65°C to 150°C |
| | | Lead Temperature (Soldering, 10 sec) | 300°C |

Note 2: Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. Exposure to any Absolute Maximum Rating condition for extended periods may affect device reliability and lifetime.

Note 3: The inputs are protected by ESD protection diodes to each power supply. If the input extends more than 500mV beyond the power supply, the input current should be limited to less than 10mA.

Note 4: Maxim specification is calculated with limited sample quantity in laboratory.

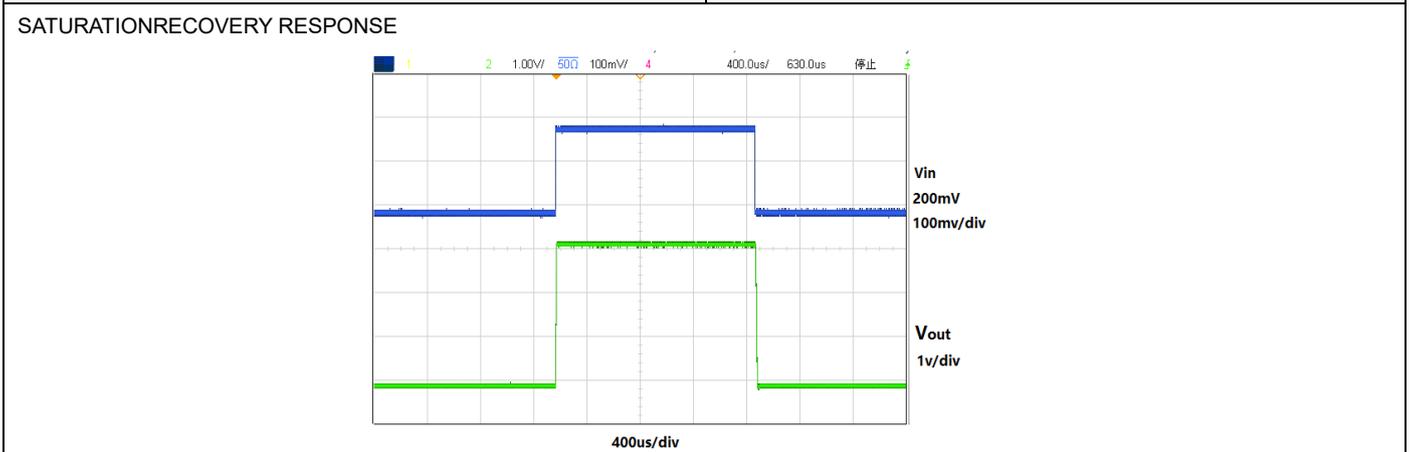

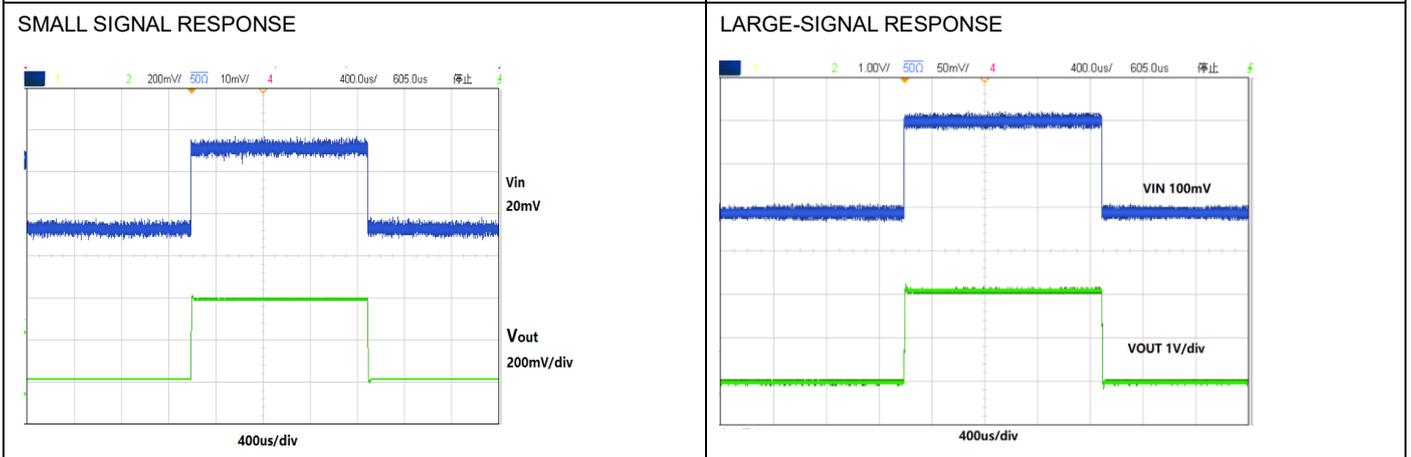

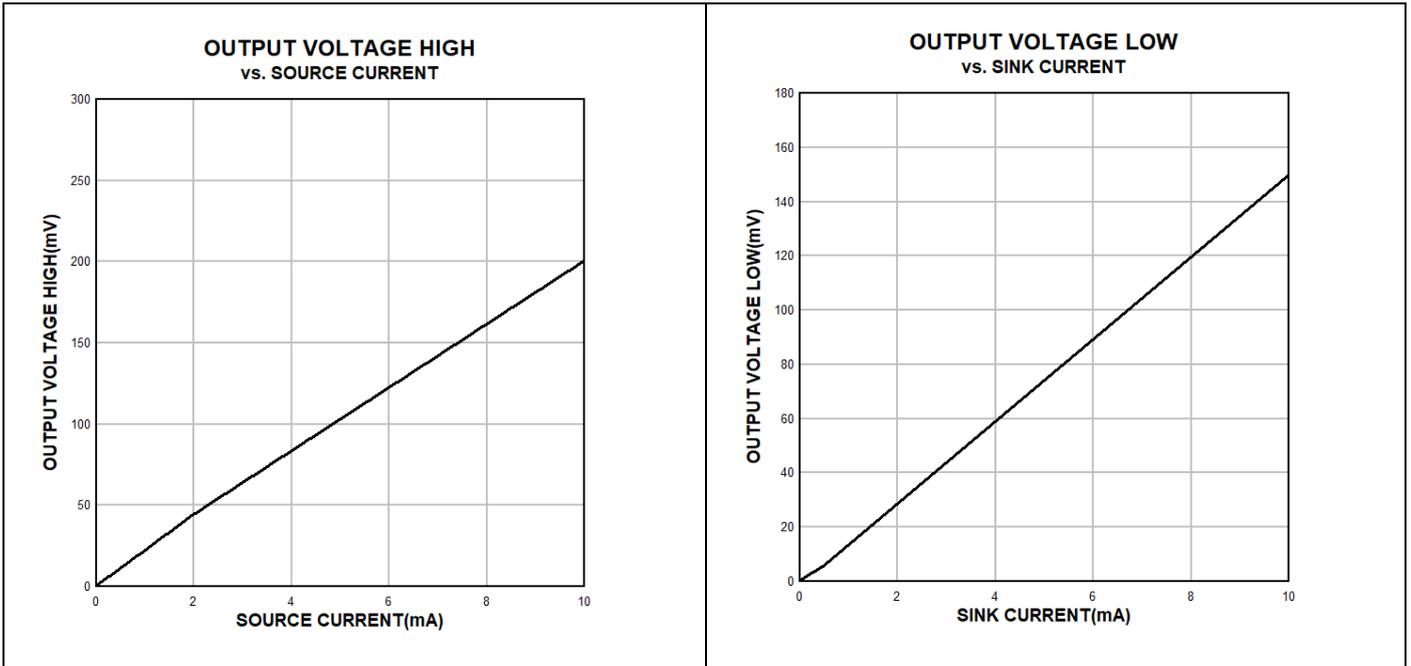

Note 5: RTI = referred to input.

Typical Performance Characteristics

The TPA1285 is used for characteristics at TA = 25°C, VSENSE = VIN+ – VIN– = 1mV, V+ = 3.3V, VIN+ = 76V, unless otherwise noted

Pin Functions

IN1-: Inverting Input of the Amplifier1.

IN1+: Non-Inverting Input of Amplifier1.

IN2-: Inverting Input of the Amplifier2.

IN2+: Non-Inverting Input of Amplifier2.

OUT1: Amplifier1 Output.

OUT2: Amplifier2 Output.

V+: Positive Power Supply. Typically, the voltage is from 3.0V to 5.5V. A bypass capacitor of 0.1 μ F as close to the part as possible should be used between power supply pin and ground pin.

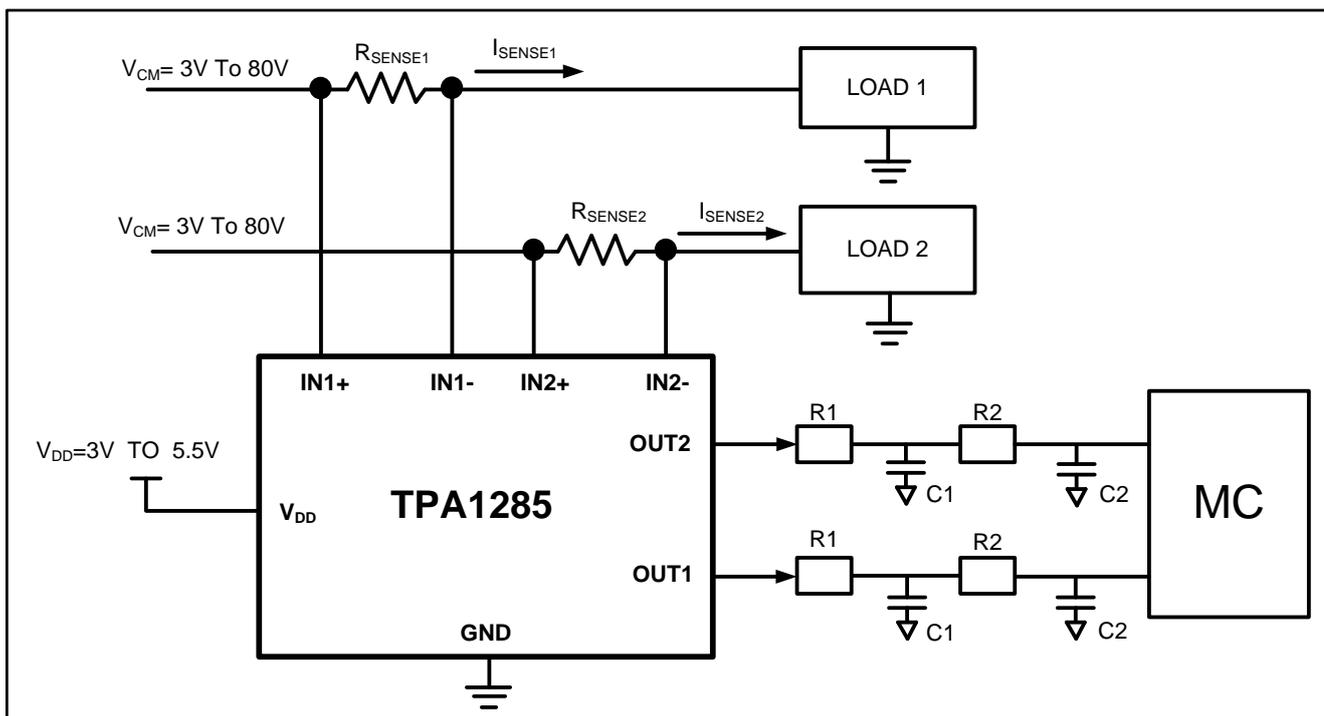

GND: Negative Power Supply.

Operation Overview

The TPA1285 family is a high voltage power supply, zero drift, 2 channel difference amplifier that uses unique architecture to accurately amplify small differential current shunt voltages, especially for fast changing common-mode voltages. In typical applications, the TPA1285 family measures current by amplifying the voltage across a shunt resistor connected to its inputs by 3 gains of 20 V/V, 50V/V and 100V/V.

Applications Information

Application schematic

Selecting Rsense

The zero-drift offset performance of the TPA1285 offers several benefits. Most often, the primary advantage of the low offset characteristic enables lower full-scale drops across the Rsense. For example, non-zero-drift current sense monitors typically require a full-scale range of 100 mV. The TPA1285 family gives equivalent accuracy at a full-scale range on the order of 5~10 mV. This accuracy reduces Rsense dissipation by an order of magnitude with many additional benefits.

Alternatively, there are applications that must measure current over a wide dynamic range that can take advantage of the low offset on the low end of the measurement. Most often, these applications can use the lower gains of the TPA1285 to accommodate larger Rsense drops on the upper end of the scale.

High Precision, High Voltage, 2ch Current Sense Amplifier

Recommended Component Values

Ideally, the maximum load current develops the full-scale sense voltage across the current-sense resistor. Choose the gain needed to match the maximum output voltage required for the application:

$$V_{out} = V_{sense} \times A_v$$

Where V_{sense} is the full-scale sense voltage, and A_v is the gain of the TPA1285.

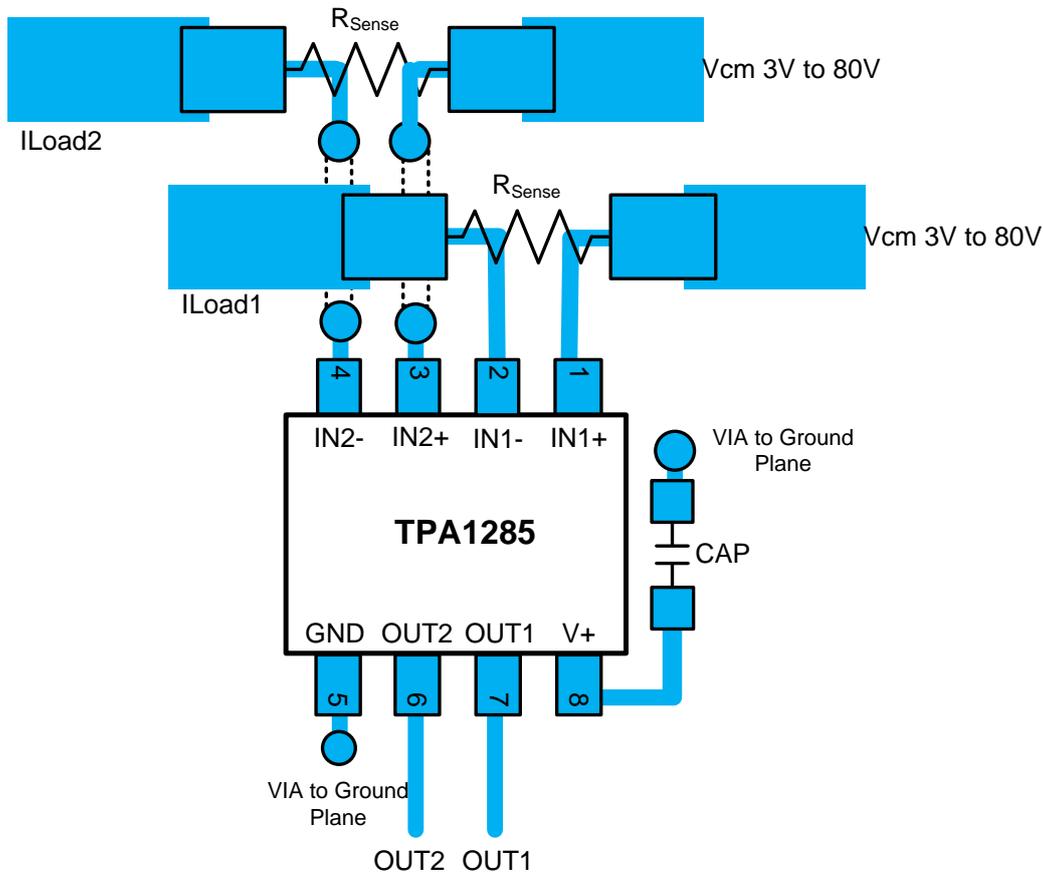

In applications of monitoring a high current, ensure that R_{sense} is able to dissipate its own I^2R power loss. If the resistor's power dissipation exceeds the nominal value, its value may drift, or it may fail altogether. The TPA1285 senses a wide variety of currents with different sense-resistor values.

Power Supply Recommendation

The input circuitry of the TPA1285 can accurately measure beyond its power-supply voltage, $V+$. For example, the $V+$ power supply can be 5V, whereas the load power-supply voltage can be as high as 80V. However, the output voltage range of the OUT pin is limited by the voltages on the power-supply pin.

Proper Board Layout

To ensure optimum performance at the PCB level, care must be taken in the design of the board layout. Poor routing of the current sensing resistor can result in additional resistance between the input pins of the amplifier. Any additional high-current carrying impedance can cause significant measurement errors because the current resistor has a very low value. Below is recommended connection to connect to the device input pins. This connection ensures that only the current-sensing resistor impedance is detected between the input pins.

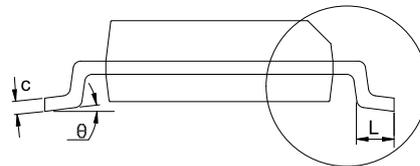

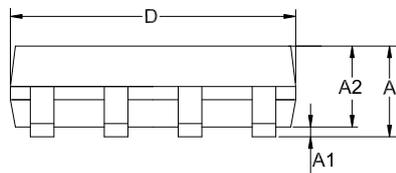

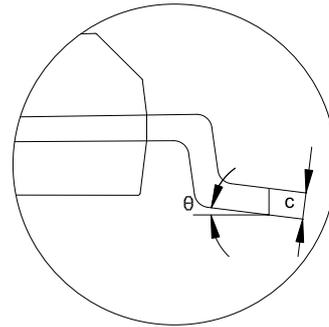

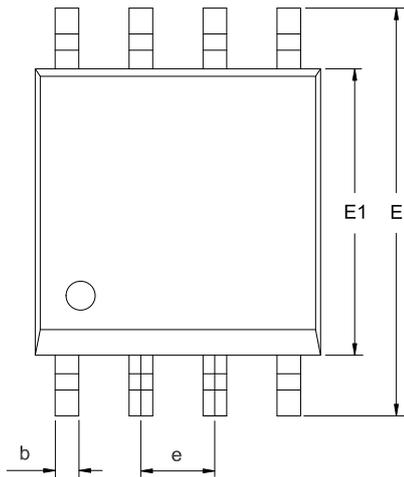

The use of a ground plane is highly recommended. A ground plane reduces EMI noise and also helps to maintain a constant temperature across the circuit board.
