

## Features

- Senses Bus Voltages From 0V to 36V
- High-Side or Low-Side Sensing
- Reports Current, Voltage, and Power
- High Accuracy
- Configurable Averaging Options
- 16 Programmable Addresses
- Operates from 2.7-V to 5.5-V Power Supply
- 10-Pin, MSOP Package

## Description

The TPA620 is a current and power monitor, with I2C or SMBUS-compatible interface. The device monitors both a shunt voltage drop and bus supply voltage.

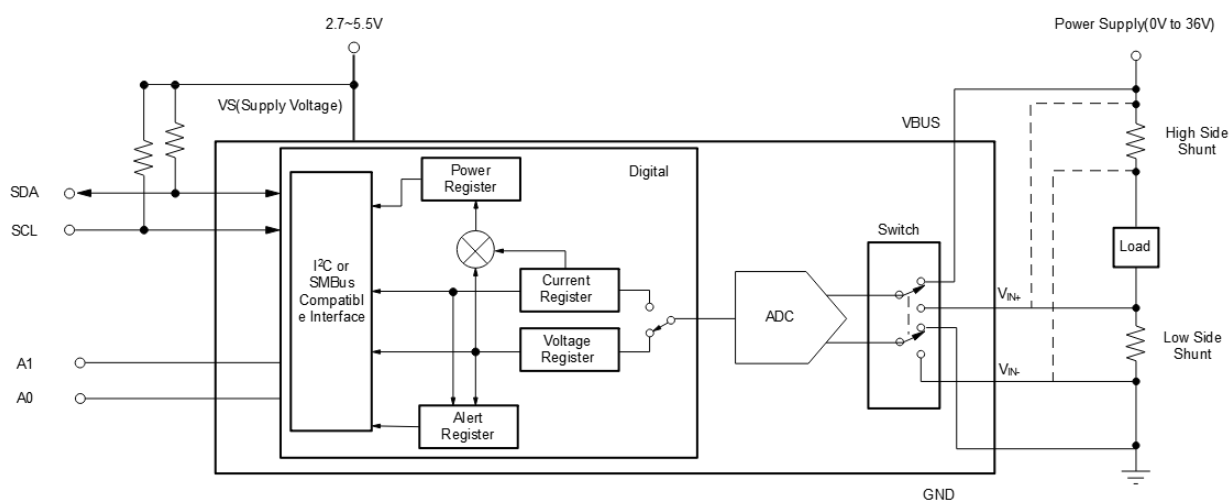

The TPA620 common mode input voltage can vary from 0V to 36V.

The TPA620 features up to 16 programmable addresses on the I2C-compatible interface.

## Applications

- Power management
- Servers
- Telecom Equipment
- Computing
- Test Equipment

$T_{STG}$	Storage Temperature Range	-65 to 150	°C

(1) Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under Recommended Operating Conditions. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

(2) IN+ and IN- may have a differential voltage between -40 V and 40 V. However, the voltage at these pins must not exceed the range -0.3 V to 40 V.

## Detail description

### Overview

The TPA620 is a digital current sense amplifier with an I2C- and SMBus-compatible interface. It performs two measurements on the power-supply bus: The differential shunt voltage created by load current flowing through a shunt resistor is measured at the IN+ and IN- pins. And the power supply bus voltage is measured at the VBUS pin.

### Serial Bus Interface

TPA620 has two I2C address pins, A0 and A1. 16 addresses are available by connecting A0 and A1 to different logic levels. At beginning of I2C communication, the states of A0 and A1 are sampled by the chip to set the I2C address. Following is the address table

*Table 1 I2C Address Table*

05	Calibration	Sets full-scale range and LSB of current and power measurements. Overall system calibration.	00000000 00000000	0000	R/W

(1) Values based on a statistical analysis of a one-time sample of devices. Minimum and maximum values are not ensured and not production tested. Condition: A0=A1=0.

Type: R = Read only, R/W = Read/Write.

(2) The Power register and Current register default to 0 because the Calibration register defaults to 0, yielding a zero current value until the Calibration register is programmed.

## Feature Description

All TPA620 registers 16-bit registers are actually two 8-bit bytes through the I<sup>2</sup>C- or SMBUS-compatible interface.

### Configuration Register (address = 00h) [reset = 399Fh]

**Table 3 Configuration Register**

Note1: R/W = Read/Write; R = Read only; -n = value after reset.

Note2: When a ADC measurement process is running, writing to this register will interrupt the current process and restart ADC measurement with the latest register configuration.

#### RST: Reset Bit

Bit 15 Setting this bit to 1 generates a system reset that is the same as power-on reset. Resets all registers to default values; this bit self-clears.

#### BRNG: Bus Voltage Range

Bit 13 0 = 16-V FSR

1 = 32-V FSR (default value)

#### PG: PGA (Shunt Voltage Only)

Bits 11, 12 Sets PGA gain and range. Note that the PGA defaults to +8 (320-mV range). Table 3 shows the gain and range for the various product gain settings.

**Table 4 PG Bit Settings [12:11] <sup>(1)</sup>**

PG1	PG0	GAIN	RANGE
0	0	1	±40 mV
0	1	/2	±80 mV
1	0	/4	±160 mV
1	1	/8	±320 mV

(1) Shaded values are default.

**BADC: BADC Bus ADC Resolution/Averaging**

Bits 7–10: These bits adjust the Bus ADC resolution (9-, 10-, 11-, or 12-bit) or set the number of samples used when averaging results for the Bus Voltage Register (02h).

**SADC: SADC Shunt ADC Resolution/Averaging**

Bits 3–6: These bits adjust the Shunt ADC resolution (9-, 10-, 11-, or 12-bit) or set the number of samples used when averaging results for the Shunt Voltage Register (01h).

BADC (Bus) and SADC (Shunt) ADC resolution/averaging and conversion time settings are shown in Table 4.

1	1	1	1	128	69.4 mS

(1) Shaded values are default.

(2) X = Don't care

**MODE: Operating Mode**

Bits 0-2: Selects continuous, triggered, or power-down mode of operation. These bits default to continuous shunt and bus measurement mode. The mode settings are shown in Table 5.

**Table 6 Mode Settings [2:0] <sup>(1)</sup>**

MODE3	MODE2	MODE1	MODE
0	0	0	Power-down
0	0	1	Shunt voltage, triggered
0	1	0	Bus voltage, triggered
0	1	1	Shunt and bus, triggered
1	0	0	ADC off (disabled)
1	0	1	Shunt voltage, continuous
1	1	0	Bus voltage, continuous
1	1	1	Shunt and bus, continuous

(1) Shaded values are default.

## Data Output Registers

### Shunt Voltage Register (address = 01h)

The Shunt Voltage register stores the current shunt voltage reading,  $V_{SHUNT}$ . Shunt Voltage register bits are shifted according to the PGA setting selected in the Configuration register (00h). When multiple sign bits are present, they are all the same value. Negative numbers are represented in 2's complement format. Generate the 2's complement of a negative number by complementing the absolute value binary number and adding 1. Extend the sign, denoting a negative number by setting the MSB = 1. Extend the sign to any additional sign bits to form the 16-bit word.

### Bus Voltage Register (address = 02h)

The Bus Voltage register stores the most recent bus voltage reading, VBUS.

**Table 12 Bus Voltage Register (BRNG = 1)**

At full-scale range = 32 V (decimal = 8000, hex = 1F40), and LSB = 4 mV.

**Table 13 Bus Voltage Register (BRNG = 0)**

At full-scale range = 16 V (decimal = 4000, hex = 0FA0), and LSB = 4 mV.

0	BD11	BD10	BD9	BD8	BD7	BD6	BD5	BD4	BD3	BD2	BD1	BD0	—	CNVR	OVF

**CNVR: Conversion Ready**

Bit 1 Although the data from the last conversion can be read at any time, the TPA620 Conversion Ready bit (CNVR) indicates when data from a conversion is available in the data output registers. The CNVR bit is set after all conversions, averaging, and multiplications are

complete. CNVR will clear under the following conditions:

- 1.) Writing a new mode into the Operating Mode bits in the Configuration Register (except for Power-Down or Disable)
- 2.) Reading the Bus Voltage Register

**OVF: Math Overflow Flag**

Bit 0 The Math Overflow Flag (OVF) is set when the Power or Current calculations are out of range. It indicates that current and power data may be meaningless.

**Power Register (address = 03h) [reset = 00h]**

Full-scale range and LSB are set by the Calibration register. The Power register records power in watts by multiplying the values of the current with the value of the bus voltage.

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

**Current Register (address = 04h) [reset = 00h]**

Full-scale range and LSB depend on the value entered in the Calibration register. Negative values are stored in 2's complement format.

**Calibration Register**

The value of the Current register is calculated by multiplying the value in the Shunt Voltage register with the value in the Calibration register.

**Calibration Register (address = 05h) [reset = 00h]**

Current and power calibration are set by bits FS15 to FS1 of the Calibration register. Note that bit FS0 is not used in the calculation. This register sets the current that corresponds to a full-scale drop across the shunt. Full-scale range and the LSB of the current and power measurement depend on the value entered in this register. This register is suitable for use in overall system calibration. Note that the 0 POR values are all default.

						0	0	0	0	0	0				

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

**Note1:** FS0 is a void bit and will always be 0. It is not possible to write a 1 to FS0. CALIBRATION is the value stored in FS15:FS1.
