

## Features

- Senses Bus Voltages From 0V to 36V
- High-Side or Low-Side Sensing
- Reports Current, Voltage, and Power
- High Accuracy
- Configurable Averaging Options
- 16 Programmable Addresses
- Operates from 2.7-V to 5.5-V Power Supply
- 10-Pin, MSOP Package

## Applications

- Power management
- Servers
- Telecom Equipment
- Computing
- Test Equipment

## Description

The TPA626 is a current and power monitor, with I<sup>2</sup>C or SMBUS-compatible interface. The device monitors both a shunt voltage drop and bus supply voltage.

The TPA626 common mode input voltage can vary from 0V to 36V.

The TPA626 features up to 16 programmable addresses on the I<sup>2</sup>C-compatible interface.

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) IN+ and IN- may have a differential voltage between -40 V and 40 V. However, the voltage at these pins must not exceed the range -0.3 V to 40 V.

## Detailed description

The TPA626 is a digital current sense amplifier with an I2C- and SMBus-compatible interface. It performs two measurements on the power-supply bus: The differential shunt voltage created by load current flowing through a shunt resistor is measured at the IN+ and IN– pins. And the power supply bus voltage is measured at the VBUS pin.

There are no special requirements for power supply sequencing, since power supply and input voltages are independent of each other.

## Programming

**SOL: Shunt Voltage Over-Voltage**

Bit 15

Setting this bit high configures the Alert pin to be asserted if the shunt voltage measurement following a conversion exceeds the value programmed in the Alert Limit Register.

**SUL: Shunt Voltage Under-Voltage**

Bit 14

Setting this bit high configures the Alert pin to be asserted if the shunt voltage measurement following a conversion drops below the value programmed in the Alert Limit Register.

**BOL: Bus Voltage Over-Voltage**

Bit 13

Setting this bit high configures the Alert pin to be asserted if the bus voltage measurement following a conversion exceeds the value programmed in the Alert Limit Register.

**BUL: Bus Voltage Under-Voltage**

Bit 12

Setting this bit high configures the Alert pin to be asserted if the bus voltage measurement following a conversion drops below the value programmed in the Alert Limit Register.

**POL: Power Over-Limit**

Bit 11

Setting this bit high configures the Alert pin to be asserted if the Power calculation made following a bus voltage measurement exceeds the value programmed in the Alert Limit Register.

**CNVR: Conversion Ready**

Bit 10

Setting this bit high configures the Alert pin to be asserted when the Conversion Ready Flag, Bit 3, is asserted indicating that the device is ready for the next conversion.

**AFF: Alert Function Flag**

Bit 4

While only one Alert Function can be monitored at the Alert pin at a time, the Conversion Ready can also be enabled to assert the Alert pin. Reading the Alert Function Flag following an alert allows the user to determine if the Alert Function was the source of the Alert.

When the Alert Latch Enable bit is set to Latch mode, the Alert Function Flag bit clears only when the Mask/Enable Register is read. When the Alert Latch Enable bit is set to transparent mode, the Alert Function Flag bit is cleared following the next conversion that does not result in an Alert condition.

**CVRF: Conversion Ready Flag**

Bit 3

Although the device can be read at any time, and the data from the last conversion is available, the Conversion Ready Flag bit is provided to help coordinate one-shot or triggered conversions. The Conversion Ready Flag bit is set after all conversions, averaging, and multiplications are complete. Conversion Ready Flag bit clears under the following conditions:

- 1.) Writing to the Configuration Register (except for Power-Down selection)
- 2.) Reading the Mask/Enable Register

**OVF: Math Overflow Flag**

Bit 2

This bit is set to '1' if an arithmetic operation resulted in an overflow error. It indicates that current and power data may be invalid.

**APOL: Alert Polarity bit; sets the Alert pin polarity.**

Bit 1

- 1 = Inverted (active-high open collector)
- 0 = Normal (active-low open collector) (default)

**LEN: Alert Latch Enable; configures the latching feature of the Alert pin and Alert Flag bits.**

Bit 0

- 1 = Latch enabled
- 0 = Transparent (default)

When the Alert Latch Enable bit is set to transparent mode, the Alert pin and Flag bit resets to the idle states when the fault has been cleared. When the Alert Latch Enable bit is set to Latch mode, the Alert pin and Alert Flag bit remains active following a fault until the Mask/Enable Register has been read.
