

0.8uA Low Power Consumption Regulator with Enable

DESCRIPTION

The BL8077 is a group of positive voltage output, low power consumption, low dropout voltage regulator. The very low power consumption of BL8077 (0.8uA, Typ) can greatly improve natural life of batteries. The BL8077 includes high accuracy voltage reference, error amplifier and output driver module with discharge capability. And it also provides foldback short-circuit protection, thermal protection and output current limit function.

The BL8077 can provide output value of fixed version as 1.2V, 1.8V, 2.5V, 2.8V, 3V, and 3.3V. It also can be customized on command.

BL8077 is available in SOT23-5 and DFN1x1-4 which are lead free.

FEATURES

- Maximum output current:300mA
- Low power consumption: 0.8uA (Typ.)
- Stand-by current: less than 0.1uA
- Operating input voltage:1.8V~5.5V
- Low dropout voltage:
150mV @100mA @Vout=3.3V (Typ.)
- Low temperature coefficient: $\pm 100\text{ppm}/^\circ\text{C}$
- Build-in chip enable and discharge circuit
- Built-in output current limit circuit

APPLICATIONS

- Mobile phones
- Battery powered equipment
- Cordless phones, wireless communication equipment
- Cameras, video recorders
- Portable AV equipment
- PDAs

TYPICAL APPLICATION

Note: Input capacitor ($C_{in}=1\mu\text{F}$) and output capacitor ($C_{out}=1\mu\text{F}$) are recommended in all application circuit.

Note:

1) $V_{DROP}=V_{IN1}-(V_{OUT2}\times 0.98)$, V_{OUT2} is the output voltage when $V_{IN}=V_{OUT1}+1.0V$ and $I_{OUT}=300mA$. V_{IN1} is the input voltage at which the output voltage becomes 98% of V_{OUT1} after gradually decreasing the input voltage.

BLOCK DIAGRAM

EXPLANATION

Output Voltage

The BL8077 can provide output value of fixed version as 1.2V, 1.8V, 2.5V, 2.8V, 3V, and 3.3V. It also can be customized on command.

Short Protection Circuit

The BL8077 regulator offers circuit protection by means of a built-in foldback circuit. When the load current reaches the current limit level, the fixed current limiter circuit operates and output voltage drops. As a result of this drop in output voltage, the foldback circuit operates, the output voltage drops further and output current decreases. When the output pin is shorted, a current of about 60mA flows.

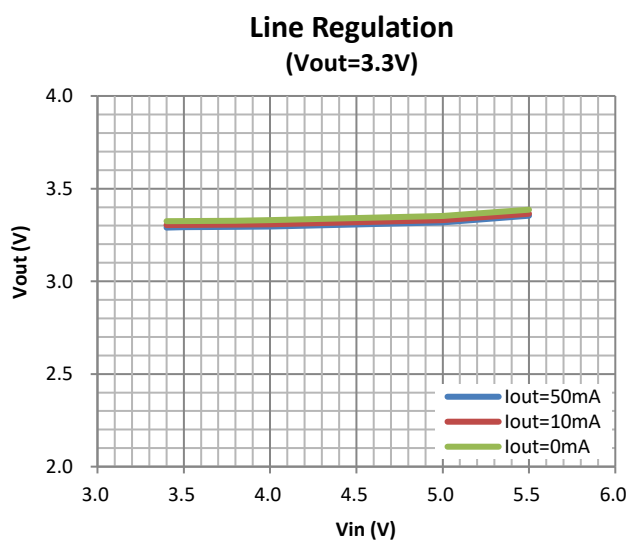

CE Pin

The IC's internal circuitry can be operated or shutdown via the signal from the CE pin with the BL8077. Note that the BL8077 regulator is "High Active/No Pull-Down", operations will become unstable with the CE pin open. We suggest that you use this IC with either a VIN voltage or a GND voltage input at the CE pin. If this IC is used with the correct specifications for the CE pin, the operational logic is fixed and the IC will operate normally. Otherwise, supply current may increase as a result of through current in the IC's internal circuitry.

Thermal Shutdown

When the junction temperature of the built-in driver transistor reaches the temperature limit, the thermal shutdown circuit operates and the driver transistor will be set to OFF. The IC resumes its operation when the thermal shutdown function is released and the IC's operation is automatically restored because the junction temperature drops to the level of the thermal shutdown release voltage.
