2.6 Watt Mono Filter-Free Class-D Audio Power Amplifier

Features

- Efficiency With an 8-Ω Speaker:
  88% at 400 mW
  80% at 100 mW
- 3.8mA Quiescent Current
- 0.4μA Shutdown Current
- Optimized PWM Output Stage Eliminates LC Output Filter
- Internally Generated 250-kHz Switching Frequency Eliminates Capacitor and Resistor
- Improved PSRR (−75 dB) and Wide Supply Voltage (2.5 V to 5.5 V) Eliminates Need for a Voltage Regulator
- Fully Differential Design Reduces RF Rectification and Eliminates Bypass Capacitor
- Improved CMRR Eliminates Two Input Coupling Capacitors
- MSOP8, SOP8 package

General Description

The BL6306 is a 2.6W high efficiency filter-free class-D audio power amplifier that requires only three external components.

Features like 88% efficiency, −75dB PSRR, and improved RF-rectification immunity make the BL6306 ideal for cellular handsets. In cellular handsets, the earpiece, speaker phone, and melody ringer can each be driven by the BL6306.

Applications

- Mobile phone、PDA、MID
- MP3/4、PMP
- Portable electronic devices

Test Circuit

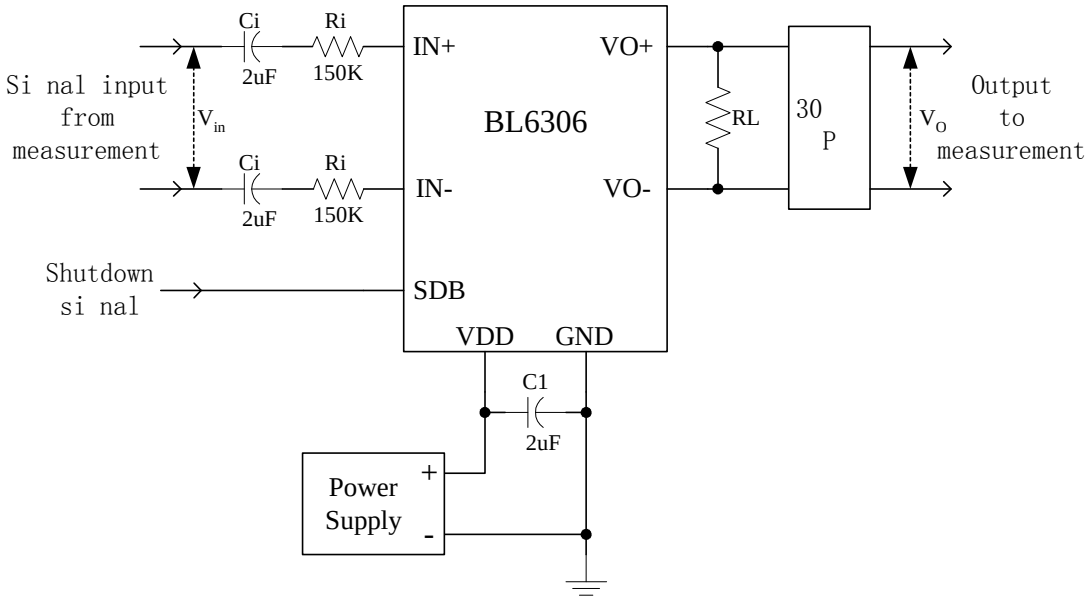

Figure 5. BL6306 test set up circuit

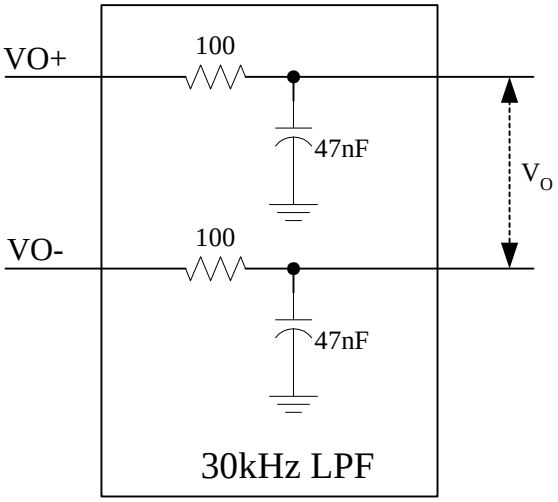

Figure 6. 30-kHz LPF for BL6306 test

Notes: 1>. C_S should be placed as close as possible to VDD/GND pad of the device
2>. Ci should be shorted for any Common-Mode input voltage measurement
3>. A 33uH inductor should be used in series with R_L for efficiency measurement
4>. The 30 kHz LPF (shown in figure 5) is required even if the analyzer has an internal LPF

Component Recommended

Due to the weak noise immunity of the single-ended input application, the differential input application should be used whenever possible. The typical component values are listed in the table:

R_I	C_I	C_S
150 k	3.3 nF	2 uF

(1) C_I should have a tolerance of ±10% or better to reduce impedance mismatch.
(2) Use 1% tolerance resistors or better to keep the performance optimized, and place the R_I close to the device to limit noise injection on the high-impedance nodes.

Input Resistors (R_I) & Capacitors (C_I)

The input resistors (R_I) set the total voltage gain of the amplifier according to *Eq1*

$$Gain = \frac{2 \times 150k\Omega}{R_I} \quad \left(\frac{V}{V}\right) \qquad Eq1$$

The input resistor matching directly affects the CMRR, PSRR, and the second harmonic distortion cancellation.

If a differential signal source is used, and the signal is biased from 0.5V ~ V_{DD}-0.8V (shown in Figure2), the input capacitor (C_I) is not required.

If the input signal is not biased within the recommended common-mode input range in differential input application (shown in Figure3), or in a single-ended input application (shown in Figure4), the input coupling capacitors are required.

If the input coupling capacitors are used, the R_I and C_I form a high-pass filter (HPF). The corner frequency (f_C) of the HPF can be calculated by *Eq2*

$$f_C = \frac{1}{2\pi \cdot R_I \cdot C_I} \quad (Hz) \qquad Eq2$$

Decoupling Capacitor (C_S)

A good low equivalent-series-resistance (ESR) ceramic capacitor (C_S), used as power supply decoupling capacitor (C_S), is required for high power supply rejection (PSRR), high efficiency and low total harmonic distortion (THD). C_S is 2μF, placed as close as possible to the device VDD pin.
