Description

The CGD65A130S2 is an enhancement mode GaN-on-silicon power transistor, exploiting the unique material properties of GaN to deliver high current, high breakdown voltage and high switching frequency for a wide range of electronics applications. The CGD65A130S2 features CGD's ICeGaN™ gate technology enabling compatibility with virtually all gate drivers and controller chips available. The integrated current sense function eliminates a separate current sense resistor and the associated efficiency losses. Because no external sense resistor is needed, the device can be directly soldered to the large copper area of the ground plane, improving the thermal performance and simplifying the thermal design. It comes in a DFN 8x8 SMD package to support high frequency operation while ensuring the highest thermal performance.

² Non-repetitive pulsed conditions.

Electrical Characteristics

Values at $T_J = 25\text{ }^\circ\text{C}$, $V_{DD} = 12\text{ V}$ if not listed. To turn the device on the recommended gate voltage range is $V_{GS} = 9\text{ V}$ to V_{DD} . To turn the device off set $V_{GS} = 0\text{ V}$. An integrated Miller Clamp eliminates the need for negative gate voltages.
