2. The Information contained herein is for informational purpose only and is provided only to illustrate the operation of Diodes' products described herein and application examples. Diodes does not assume any liability arising out of the application or use of this document or any product described herein. This document is intended for skilled and technically trained engineering customers and users who design with Diodes' products. Diodes' products may be used to facilitate safety-related applications; however, in all instances customers and users are responsible for (a) selecting the appropriate Diodes products for their applications, (b) evaluating the suitability of Diodes' products for their intended applications, (c) ensuring their applications, which incorporate Diodes' products, comply the applicable legal and regulatory requirements as well as safety and functional-safety related standards, and (d) ensuring they design with appropriate safeguards (including testing, validation, quality control techniques, redundancy, malfunction prevention, and appropriate treatment for aging degradation) to minimize the risks associated with their applications.
3. Diodes assumes no liability for any application-related information, support, assistance or feedback that may be provided by Diodes from time to time. Any customer or user of this document or products described herein will assume all risks and liabilities associated with such use, and will hold Diodes and all companies whose products are represented herein or on Diodes' websites, harmless against all damages and liabilities.
4. Products described herein may be covered by one or more United States, international or foreign patents and pending patent applications. Product names and markings noted herein may also be covered by one or more United States, international or foreign trademarks and trademark applications. Diodes does not convey any license under any of its intellectual property rights or the rights of any third parties (including third parties whose products and services may be described in this document or on Diodes' website) under this document.
5. Diodes' products are provided subject to Diodes' Standard Terms and Conditions of Sale (<https://www.diodes.com/about/company/terms-and-conditions/terms-and-conditions-of-sales/>) or other applicable terms. This document does not alter or expand the applicable warranties provided by Diodes. Diodes does not warrant or accept any liability whatsoever in respect of any products purchased through unauthorized sales channel.
6. Diodes' products and technology may not be used for or incorporated into any products or systems whose manufacture, use or sale is prohibited under any applicable laws and regulations. Should customers or users use Diodes' products in contravention of any applicable laws or regulations, or for any unintended or unauthorized application, customers and users will (a) be solely responsible for any damages, losses or penalties arising in connection therewith or as a result thereof, and (b) indemnify and hold Diodes and its representatives and agents harmless against any and all claims, damages, expenses, and attorney fees arising out of, directly or indirectly, any claim relating to any noncompliance with the applicable laws and regulations, as well as any unintended or unauthorized application.
7. While efforts have been made to ensure the information contained in this document is accurate, complete and current, it may contain technical inaccuracies, omissions and typographical errors. Diodes does not warrant that information contained in this document is error-free and Diodes is under no obligation to update or otherwise correct this information. Notwithstanding the foregoing, Diodes reserves the right to make modifications, enhancements, improvements, corrections or other changes without further notice to this document and any product described herein. This document is written in English but may be translated into multiple languages for reference. Only the English version of this document is the final and determinative format released by Diodes.
8. Any unauthorized copying, modification, distribution, transmission, display or other use of this document (or any portion hereof) is prohibited. Diodes assumes no responsibility for any losses incurred by the customers or users or any third parties arising from any such unauthorized use.

1 FEATURES

- 24-lane PCI Express® Gen 2 Switch with 12 PCI Express ports
- Supports “Cut-through”(Default) as well as “Store and Forward” mode for packet switching
- 150 ns typical latency for packet routed through Switch without blocking
- Integrated reference clock for downstream ports
- Supports internal Direct Memory Access (DMA) engine to move data between two address locations
- Supports Transparent and Non-Transparent Modes
- Strapped pins configurable with optional EEPROM or I2C Bus
- I2C Slave interface support
- Compliant with I2C Bus Specification, Version 2.1
- Compliant with *PCI Express Base Specification Revision 2.1*
- Compliant with *PCI Express CEM Specification Revision 2.0*
- Compliant with *PCI-to-PCI Bridge Architecture Specification Revision 1.2*
- Compliant with *Advanced Configuration Power Interface (ACPI) Specification*
- Reliability, Availability and Serviceability
 - Supports Data Poisoning and End-to-End CRC
 - Advanced Error Reporting and Logging
- Advanced Power Saving
 - Empty downstream ports are set to idle state to minimize power consumption
- Link Power Management
 - Supports L0, L0s, L1, L2, L2/L3_{Ready} and L3 link power states
 - Active state power management for L0s and L1 states
- Device State Power Management
 - Supports D0, D3_{Hot} and D3_{Cold} device power states
- Port Arbitration: Round Robin (RR), Weighted RR and Time-based Weighted RR
- Extended Virtual Channel capability
 - Two Virtual Channels (VC) and Eight Traffic Class (TC) support
 - Disabled VCs’ buffer is assigned to enabled VCs for resource sharing
 - Independent TC/VC mapping for each port
 - Provides VC arbitration selections: Strict Priority, Round Robin (RR) and Programmable Weighted RR
- Supports Isochronous Traffic
 - Isochronous traffic class mapped to VC1 only
 - Strict time based credit policing
- Supports up to 512-byte maximum payload size
- Programmable driver current and de-emphasis level at each individual port
- Support Access Control Service (ACS) for peer-to-peer traffic
- Support Address Translation (AT) packet for SR-IOV application
- Support Alternative Routing ID Interpretation (ARI)
- Support Multicast
- Support Serial Hot Plug Controller
- Low Power Dissipation: 2.1 W typical in L0 normal mode (Including clock buffer Pd)
- Industrial Temperature Range -40° to 85°C
- Totally Lead-Free & Fully RoHS Compliant (Notes 1 & 2)
- Halogen and Antimony Free. “Green” Device (Note 3)
- For automotive applications requiring specific change control (i.e. parts qualified to AEC-Q100/101/104/200, PPAP capable, and manufactured in IATF 16949 certified facilities), please [contact us](#) or your local Diodes representative.

2 GENERAL DESCRIPTION

Similar to the role of PCI/PCIX Bridge in PCI/PCIX bus architecture, the function of PCI Express (PCIE) Switch is to expand the connectivity to allow more end devices to be reached by host controllers in PCIE serial interconnect architecture. The 24-lane PCIE Switch is in 12-port type configuration. It provides users the flexibility to expand or fan-out the PCI Express lanes based on their application needs.

In the PCI Express Architecture, the PCIE Switch forwards posted and non-posted requests, and completion packets in either downstream or upstream direction concurrently as if a virtual PCI Bridge is in operation on each port. By visualizing the port as a virtual Bridge, the Switch can be logically viewed as two-level cascaded multiple virtual PCI-to-PCI Bridges, where one upstream-port Bridge sits on all downstream-port Bridges. Similar to a PCI Bridge during enumeration, each port is given a unique bus number, device number, and function number by the initiating software. The bus number, device number, and function number are combined to form a destination ID for each specific port. In addition to that, the memory-map and IO address ranges are exclusively allocated to each port as well. After the software enumeration is finished, the packets are routed to the dedicated port based on the embedded address or destination ID. To ensure the packet integrity during forwarding, the Switch is not allowed to split the packets to multiple small packets or merge the received packets into a large transmit packet. Also, the IDs of the requesters and completers are kept unchanged along the path between ingress and egress port.

The Switch employs the architecture of Combined Input and Output Queue (CIOQ) in implementation. The main reason for choosing CIOQ is that the required memory bandwidth of input queue equals to the bandwidth of ingress port rather than increasing proportionally with port numbers as an output queue Switch does. The CIOQ at each ingress port contains separate dedicated queues to store packets. The packets are arbitrated to the egress port based on the PCIE transaction-ordering rule. For the packets without ordering information, they are permitted to pass over each other in case that the addressed egress port is available to accept them. As to the packets required to follow the ordering rule, the Head-Of-Line (HOL) issue becomes unavoidable for packets destined to different egress ports since the operation of producer-consumer model has to be retained; otherwise the system might occur hang-up problem. On the other hand, the Switch places replay buffer at each egress port to defer the packets before sending it out. This can assure the maximum throughput being achieved and therefore the Switch works efficiently. Another advantage of implementing CIOQ in PCIE Switch is that the credit announcement to the counterpart is simplified and streamlined because of the credit-based flow control protocol. The protocol requires that each ingress port maintains the credits independently without checking other ports' credit availability, which is otherwise required by pure output queue architecture.

The Switch supports two virtual channels (VC0, VC1) and eight traffic classes (TC0 ~ TC7) at each port. The ingress port independently assigns packets into the preferred virtual channel while the egress port outputs the packet based on the predefined port and VC arbitration algorithm. For instance, the isochronous packet is given a special traffic class number other than TC0 and mapped into VC1 accordingly. By employing the strict time based credit policy for port arbitration and assigning higher priority to VC1 than VC0, the Switch can therefore guarantee the time-sensitive packet is not blocked by regular traffic to assure the quality of service. In addition, some data-centric applications only carry TC0/VC0 traffic. As a result, there are no packets that would consume VC1 bandwidth. In order to improve the efficiency of buffer usage, the unused VC1 queues can be reassigned to VC0 and enable each of the ingress ports to handle more data traffic bursts. This virtual channel resource relocation feature enhances the performance of the PCIE Switch further.

The built-in Integrated Reference Clock Buffer of the PCI Express Switch supports seven reference clock outputs. The clock buffer is from a single 100MHz clock input, and distributes the clock source to seven outputs, which can be used by the PCI Express Switch and the downstream PCI Express end devices. The clock buffer feature can be enabled and disabled by EEPROM or I2C.

The DIODES™ PI7C9X2G1224GP supports various types of power management ranged from device state, link state to platform-wise power saving mechanism. For device state, the D0, D1, D2, D3-hot, and D3-cold power states represent different amount of power dissipation in PI7C9X2G1224GP. As to link state, each link of the PI7C9X2G1224GP supports the PCI Express Link Power Management with L0, L0s, L1, L2/L3 ready and L2/L3 power states.

DIODES is a trademark of Diodes Incorporated in the United States and other countries.

Non-Transparent (NT) Bridging is supported by the packet switch. The NT bridge allows two separate Hosts to be connected together. One single port of the packet switch can be configured to operate in NT mode. While the port is in NT mode, the packet switch allows the isolation of address spaces, and the packet switch acts as an endpoint to the Host to allow inter-processor communication. NT mode is enabled and disabled by toggling the NT_EN_L strapping pin.

The packet switch supports internal Direct Memory Access (DMA) functionality to move data between two address locations. Two types of DMA engines are supported: DMA_UP and DMA_NT. The upstream port uses DMA_UP engine to move data in Host processor address domain. And the non-transparent port uses DMA_NT to move inter-processor data. The DMA engines have two built-in data channels: channel 0 and channel 1. The packet switch also provides a flexibility to manage these DMA engines. If the NT port is not enabled, all of the DMA engines would be allocated to upstream port domain.

3 PIN DESCRIPTION

3.1 PCI EXPRESS INTERFACE SIGNALS (125 BALLS)

NAME	PIN	TYPE	DESCRIPTION
REFCLKP REFCLKN	U8 V8	I	Reference Clock Input Pairs: Connect to 100MHz differential clock. The input clock signals must be delivered to the clock buffer cell through an AC-coupled interface so that only the AC information of the clock is received, converted, and buffered. It is recommended that a 0.1uF be used in the AC-coupling.
PERP[23:0]	E4,E5,E6,E7,E9,E10,E11,E12, E14,F14,G14,H14,K14,L14,M14, N14, P12,P11,P10,P9,P7,P6,P5,P4	I	PCI Express Data Serial Input Pairs: Differential data receive signals in sixteen ports.
PERN[23:0]	D4,D5,D6,D7,D9,D10,D11,D12, E15,F15,G15,H15,K15,L15,M15, N15,R12,R11,R10,R9,R7,R6,R5, R4	I	Please refer to Section 5 for Mapping of the Lanes to transmission and receive pairs and configuration of Port-Lane.
PETP[23:0]	B4,B5,B6,B7,B9,B10,B11,B12, E17,F17,G17,H17,K17,L17,M17, N17,U12,U11,U10,U9,U7,U6,U5, U4	O	PCI Express Data Serial Output Pairs: Differential data transmit signals in sixteen ports.
PETN[23:0]	A4,A5,A6,A7,A9,A10,A11,A12, E18,F18,G18,H18,K18,L18,M18, N18,V12,V11,V10,V9,V7,V6,V5, V4	O	Please refer to Section 5 for Mapping of the Lanes to transmission and receive pairs and configuration of Port-Lane.
PERST_L	U1	I	System Reset (Active LOW): When PERST_L is asserted, the internal states of whole chip except sticky logics are initialized. Please refer to Table 11-2 for PERST_L Spec.
REXT[2:0]	D8,J15,R8	I	External Reference Resistor: Connect an external resistor (1.43K Ohm +/- 1%) to REXT_GND to provide a reference to both the bias currents and impedance calibration circuitry.
REXT_GND[2:0]	E8,J14,P8	I	External Reference Resistor Ground: Connect to an external resistor to REXT.
REFCLKIP REFCLKIN	K1 K2	I	Integrated Reference Clock Input Pair: Connect to external 100MHz differential clock for the integrated reference clock buffer. If the reference clock input is HCSL type, it can be AC or DC coupled. If the 100MHz clock source is not in HCSL protocol (ex: LVPECL, LVDS, etc), please refer to application note to add application circuit.
REFCLKOP[8:1]	H3,H1,J3,J1,K3,L3,L1,M3	O	Integrated Reference Clock Output Pairs: 100MHz external differential HCSL clock outputs for the integrated reference clock buffer. Integrated reference clock outputs are turned on at 324/424/524/624 modes. They are turned off at 1224 and 1124 modes.
REFCLKON[8:1]	H4,H2,J4,J2,K4,L4,L2,M4		
IREF	M1	I	Differential Reference Clock Output Current Resistor: External resistor (475 Ohm +/- 1%) connection to set the differential reference clock output current.
NT RESET_L	T14	O	Propagate Reset in NT mode: Pulse width is 1 us.

3.2 PORT SPECIFIC SIGNALS (17 BALLS)

NAME	PIN	TYPE	DESCRIPTION
PORT_GOOD_L[9,8,6,5,1,0]	U18,P16,G2,F2,E1,F1	O	Port Good Status: These signals indicate the link status of each port. When continuously deasserts, the device is in the condition of link down. When continuously asserts, the link is up and operates at 5GT/s. When blinking, asserts and deasserts with 0.5-second intervals, the link is up and operates at 2.5GT/s. PORT_GOOD_L[x] is correspondent to Port x, where x=0,1,5,6,8,9.
UPS_PORTSEL[3:0]	A15,P15,P14,C13	I	Upstream Port Selection: These signals decide which port will be the upstream port. Please refer to Section 5 for Port-Lane Mapping. These strapping pins have no built-in internal resistors and can not be left NC. These pins require the external 5.1K-ohm pull-up resistors or 330-ohm pull-down resistors.
PORTCFG[2:0]	B13,B3,P13	I	Port-Lane Configuration: These signals decide Port-Lane configuration. Please refer to Section 5 for Port-Lane Mapping. These strapping pins have no built-in internal resistors and can not be left NC. These pins require the external 5.1K-ohm pull-up resistors or 330-ohm pull-down resistors.
NT_EN_L	A3	I	NT Mode Enable: When tied low, NT mode is enabled. When tied high, NT mode is disabled. This strapping pin has no built-in internal resistor and cannot be left NC. The pin requires an external 5.1K-ohm pull-up resistor or 330-ohm pull-down resistor.
NT_P2P_EN_L	U14	I	NT PCI-to-PCI Bridge Mode Enable: When tied low, NT PCI-to-PCI bridge mode is enabled. When tied high, NT PCI-to-PCI bridge mode is disabled. This pin has internal pull-up. If no board trace is connected to this pin, the internal pull-up resistor of this pin is enough. However, if pin is connected to a board trace and not driven, it is recommended that an external 5.1K-ohm pull-up resistor be used.
NT_PORTSEL[1:0]	D3,C3	I	NT Port Selection: These signals decide which port will be the upstream NT port. Please refer to Section 5 for Port-Lane Mapping. These strapping pins have no built-in internal resistors and cannot be left NC. These pins require the external 5.1K-ohm pull-up resistors or 330-ohm pull-down resistors.

3.3 HOTPLUG SIGNALS (33 BALLS)

NAME	PIN	TYPE	DESCRIPTION
HP_ATNLED_C/B/A_L	C14,H5,U17	I/O	Hot Plug Attention LED Outputs: It is used to drive the Attention Indicator. Output is asserted low to turn on the LED.
HP_BUTTON_C/B/A_L	B16,R1,T17	I/O	Hot Plug Attention Button Inputs: It is directly connected to the Attention Button.
HP_CLKEN_C/B/A_L	C15,P3,R15	I/O	Hot Plug Reference Clock Enable Outputs: It is used to control the connection of the external REFCLK to the slot.
HP_MRL_C/A_L	B15,U16	I/O	Hot Plug Manually Operated Retention Latch Sensor Inputs: It is connected directly to an optional MRL sensor that is logic low when the latch is close.
HP_MRL_B_L	N3	I	Hot Plug Manually Operated Retention Latch Sensor Inputs: It is connected directly to an optional MRL sensor that is logic low when the latch is close.
HP_PERST_C/B/A_L	B14,R2,T16	I/O	Hot Plug Reset Outputs: It is used to reset the slot.
HP_PRSNT_C/B/A_L	B17,T1,V17	I/O	Hot Plug PRSNT2# Inputs: It connects to the slot's PRSNT2# signal.
HP_PWREN_C/B/A	A16,V1,V16	I/O	Hot Plug Power Enable Outputs: It is used to control the slot power state.

NAME	PIN	TYPE	DESCRIPTION
HP_PWRFLT_C/B/A_L	A17,P2,R16	I/O	Hot Plug Power Fault Inputs: It is used to indicate that the slot's external Power Controller detected a power fault.
HP_PWR_GOOD_C/B/A	D17,N1,U15	I	Hot Plug Power Good Inputs: It is used to indicate that the power supplies are active and stable.
HP_PWRLED_C/B/A_L	D15,T2,V15	I/O	Hot Plug Power LED Outputs: It is used to drive the Power Indicator. This output is asserted low to turn on the LED.
SHCL_I2C	R14	OD	I2C Clock Signal of Serial Hot Plug Controller: It is connected to SCL pin of all I2C IO expanders.
SHDA_I2C	V14	OD	I2C Data Signal of Serial Hot Plug Controller: It is connected to SDA pin of all I2C IO expanders.
SHPCINT_L	E3	I	Interrupt Input (Active Low) of Serial Hot Plug Controller: It is connected to INT# output pin of all I2C IO expanders. When asserted, it notifies Hot Plug Controller to access the port registers of all I/O expanders for touching changed status to de-assert INT#.

3.4 EEPROM and I2C SIGNALS (9 BALLS)

NAME	PIN	TYPE	DESCRIPTION
EECK	C17	I/O	EEPROM Clock: Clock signal to 4-wire EEPROM interface.
EEDI	C16	O	EEPROM Data Input: Diodes 2G1224GP outputs data to the Data Input pin of Serial EEPROM.
EEDO	D16	I	EEPROM Data Output: Diodes 2G1224GP inputs data from the Data Output pin of Serial EEPROM.
EECS_L	C18	I/O	EEPROM Chip Select (Active Low): Diodes 2G1224GP asserts this signal to enable Serial EEPROM. EEPROM Bypass Mode (EEPROM_BYPASS): During system initialization, EECS_L acts as the EEPROM_BYPASS pin. When tied high, eeprom function is disabled. When tied low, eeprom function is enabled. This pin has internal pull-up resistor. If no board trace is connected to this pin, the internal pull-up resistor of this pin is enough. However, if pin is connected to a board trace and not driven, it is recommended that an external 5.1K-ohm pull-up resistor be used.
SCL_I2C	C1	OD	I2C Serial Clock: I2C Bus Clock. This pin requires an external 5.1K-ohm pull-up resistor.
SDA_I2C	D1	OD	I2C Serial Data: Bi-Directional I2C Bus Data. This pin requires an external 5.1K-ohm pull-up resistor.
I2C_ADDR[2:0]	G4,F3,G1	I	I2C Slave Address Bit [2:0]: These pins are used to configure the value of the three least significant bits of the PI7C2G1224GP 7-bit Slave address. These pins require the external 5.1K-ohm pull-up resistors or 330-ohm pull-down resistors.

3.5 MISCELLANEOUS SIGNALS (29 BALLS)

NAME	PIN	TYPE	DESCRIPTION
GPIO[11,10,7,4:2] / PORT_GOOD_L[11,10,7,4:2]	T18,R17,G5,G3, P1,N2	I/O O	<p>General Purpose Input and Output: When PORT_GOOD_LED_EN tied high, these general-purpose pins are programmed as either input-only or bi-directional pins by writing the GPIO output enable control register.</p> <p>Port Good Status: When PORT_GOOD_LED_EN tied low, these signals indicate the link status of each port. When continuously deasserts, the device is in the condition of link down. When continuously asserts, the link is up and operates at 5GT/s. When blinking, asserts and deasserts with 0.2-second intervals, the link is up and operates at 2.5GT/s.</p> <p>PORT_GOOD_L[x] is correspondent to Port x, where x=2,3,4,7,10,11.</p>
GPIO[19:12]	V2,T3,R3,U3, R18,V18,B18, A18	I/O	<p>General Purpose Input and Output: These eight general-purpose pins are programmed as either input-only or bi-directional pins by writing the GPIO output enable control register.</p> <p>CFG Timer Enable (CFG_TIMER_EN_L): During system initialization, GPIO[18] acts as the CFG_TIMER_EN_L pin. When tied high, TS pkts always advertises support for GENII data rate and autonomous change. When tied low, if the LTSSM fails during the Configuration state, TS pkts only advertises GENI data rate and no autonomous change support in next time the LTSSM exists the Detect state. If the LTSSM fails continuously in Configuration state, the LTSSM continues to alternate between GENI and GENII advertisement every time it exists the Detect state. This pin has internal pull-up. If no board trace is connected to this pin, the internal pull-up resistor of this pin is enough. However, if pin is connected to a board trace and not driven, it is recommended that an external 5.1K-ohm pull-up resistor be used.</p>
FATAL_ERR_L	A14	O	Fatal Error Output: It is asserted low when a Fatal error is detected.
INTA_L	B1	OD	Interrupt Output Enable: When tied low, it indicates that one or more of the following events/errors are detected: Hot Plug events, Link State events, General-Purpose Input Interrupt events, Device-Specific errors, Device-Specific NT Port Link Interface errors and events, NT-Virtual Doorbell events or NT-Link Doorbell events.
DEBUG_SEL[1:0]	U2,U13	I	<p>Test Only Must be pulled up by an external 5.1K-ohm resistor.</p> <p>Port Good Enable (PORT_GOOD_LED_EN): During system initialization, DEBUG_SEL[1] acts as the PORT_GOOD_LED_EN pin. When tied high, PORT_GOOD_L[9,8,6,5,1,0] and GPIO[11:10,7,4:2] are port good status pins. Otherwise, PORT_GOOD_L[9,8,6,5,1,0] does not work and GPIO[11:10,7,4:2] are general purpose input and output pins. This strapping pin has no built-in internal resistor and cannot be left NC. The pin requires an external 5.1K-ohm pull-up resistor or 330-ohm pull-down resistor.</p>
FAST_MODE_L	N13	I	Test Only Must be pulled up by an external 5.1K-ohm resistor
SERDES_MODE_EN_L	P18	I	Test Only Must be pulled up by an external 5.1K-ohm resistor.
TESTMODE[2]	T13	I	<p>Test Only Must be pulled up by an external 5.1K-ohm resistor.</p> <p>Gen1 Cap. Only Enable (GENICAP_ONLY_EN_L): During system initialization, TESTMODE[2] acts as the GENICAP_ONLY_EN_L pin. When tied high, the max. link speed is set to 5.0 G b/s. When tied low, the max. link speed is set to 2.5G b/s. This strapping pin has no built-in internal resistor and can not be left NC. The pin requires an external 5.1K-ohm pull-up resistor or 330-ohm pull-down resistor.</p>

NAME	PIN	TYPE	DESCRIPTION
TESTMODE[1:0]	V13,V3	I	Test Only Must be pulled down by an external 330-ohm resistor.
PLL_BYPASS_L	P17	I	Test Only Must be pulled up by an external 5.1K-ohm resistor.
NC	A8,B8,J17,J18, R13		No Connection: leaves these pins floating.

3.6 JTAG BOUNDARY SCAN SIGNALS (5 Balls)

Name	Pin	Type	Description
TCK	A2	I	Test Clock: Used to clock state information and data into and out of the chip during boundary scan. When JTAG boundary scan function is not implemented, this pin should be left open (NC).
TDI	A1	I	Test Mode Select: Used to control the state of the Test Access Port controller. When JTAG boundary scan function is not implemented, this pin should be pulled low through a 330-Ohm pull-down resistor.
TDO	B2	O	Test Data Output: When SCAN_EN is high, it is used (in conjunction with TCK) to shift data out of the Test Access Port (TAP) in a serial bit stream. When JTAG boundary scan function is not implemented, this pin should be left open (NC).
TMS	E2	I	Test Data Input: When SCAN_EN is high, it is used (in conjunction with TCK) to shift data and instructions into the TAP in a serial bit stream. When JTAG boundary scan function is not implemented, this pin should be left open (NC).
TRST_L	D2	I	Test Reset (Active LOW): Active LOW signal to reset the TAP controller into an initialized state. When JTAG boundary scan function is not implemented, this pin should be pulled low through a 330-Ohm pull-down resistor.

3.7 POWER PINS (106 BALLS)

NAME	PIN	TYPE	DESCRIPTION

Notes:

P0: upstream port

P1~P11: downstream ports

The table below shows all acceptable values of UPS_PORTSEL[3:0] and NT_PORTSEL[1:0] in different functional mode.

Acceptable Values	UPS_PORTSEL[3:0]	NTPORT_SEL[1:0]
1224 Mode	0~3 are allowed	0~3 are allowed
1124 Mode	0 is allowed	1~3 are allowed
624 Mode	0~5 are allowed	0~3 are allowed
524 Mode	0 is allowed	1 and 3 are allowed
424 Mode	0 and 1 are allowed	0 and 1 are allowed
324 Mode	0~2 are allowed	0~2 are allowed

Notes:

- 1) Upstream port is on P0, and NT port is on P1 if NT mode is enabled.
- 2) It is forbidden that NT_PORTSEL[1:0] and UPS_PORTSEL[3:0] have the same values.
- 3) For example, in 1224 mode, by default, Port 0 is mapped to Lane 0~3 and Port 3 is mapped to Lane 20~23.
When UPS_PORTSEL is set to 3, Port 0 will be changed to map to Lane 20~23 and Port 3 be changed to map to Lane 0~3.
- 4) For example, in 1224 mode, by default, Port 1 is NT port and mapped to Lane 16~19 if NT mode is enabled, and Port 2 is mapped to Lane 8~11.
When UPS_PORTSEL is set to 3 and NT_PORTSEL is set to 2,
Port 0 will be changed to map to Lane 20~23 (Up port)
Port 3 will be changed to map to Lane 0~3
Port 1 will be changed to map to Lane 8~11 (NT port)
Port 2 will be changed to map to Lane 16~19

6 FUNCTIONAL DESCRIPTION

Multiple virtual PCI-to-PCI Bridges (VPPB), connected by a virtual PCI bus, reside in the Switch. Each VPPB contains the complete PCIe architecture layers that consist of the physical, data link, and transaction layer. The packets entering the Switch via one of VPPBs are first converted from serial bit-stream into parallel bus signals in physical layer, stripped off the link-related header by data link layer, and then relayed up to the transaction layer to extract out the transaction header. According to the address or ID embedded in the transaction header, the entire transaction packets are forwarded to the destination VPPB for formatting as a serial-type PCIe packet through the transmit circuits in the data link layer and physical layer. The following sections describe these function elements for processing PCIe packets within the Switch.

6.1 PHYSICAL LAYER CIRCUIT

The physical layer circuit design is based on the PHY Interface for PCI Express Architecture (PIPE). It contains Physical Media Attachment (PMA) and Physical Coding Sub-layer (PCS) blocks. PMA includes Serializer/ Deserializer (SERDES), PLL¹, Clock Recovery module, receiver detection circuits, beacon transmitter, electrical idle detector, and input/output buffers. PCS consists of framer, 8B/10B encoder/decoder, receiver elastic buffer, and PIPE PHY control/status circuitries. To provide the flexibility for port configuration, each lane has its own control and status signals for MAC to access individually. The main functions of physical layer circuits include the conversion between serial-link and parallel bus, provision of clock source for the Switch, resolving clock difference in receiver end, and detection of physical layer errors.

In order to meet the needs of different application, the drive amplitude, de-emphasis and equalization of each transmitting channels can be adjusted using EEPROM or I2C individually. De-emphasis of -3.5 db is implemented by the transmitters when full swing signaling is used, while an offset can be individually applied to each channel.

6.1.1 RECEIVER DETECTION

The physical layer circuits implement receiver detection, which detects the presence of an attached 50 ohm to ground termination as per PCI Express Specification. The detect circuits determine if the voltage levels of the receiver have crossed the internal threshold after a configurable time determined by the Receiver Detection Threshold field in the PHY Parameter 2 Register (offset 858h, bit[6:4]) as listed in Table 6-1, which can be configured by EEPROM or I2C settings.

Table 6-1 Receiver Detection Threshold Settings

Receiver Detection Threshold	Threshold
000	1.0 us
001	2.0 us
010	4.0 us (Recommended)
011	5.0 us
100	7.0 us
101	Reserved
110	Reserved
111	Reserved

¹ Multiple lanes could share the PLL.

6.1.2 RECEIVER SIGNAL DETECTION

Receiver signal idling is detected with levels above a programmable threshold specified by Receiver Signal Detect field in the PHY Parameter 2 Register (offset 858h, bit[21:20]) as listed in Table 6-2, and can be configured on a per-port basis via EEPROM or I2C settings.

Table 6-2 Receiver Signal Detect Threshold

Receiver Signal Detect	Min (mV ppd)	Max (mV ppd)
00	50	150
01 (Recommended)	65	175
10	75	200
11	120	240

6.1.3 RECEIVER EQUALIZATION

The receiver implements programmable equalizer via the Receiver Equalization field in the PHY Parameter 2 Register (offset 858h, bit[25:22] and bit[29:26]) as listed in Table 6-3, which can be configured on a per-port basis via EEPROM or I2C settings.

Table 6-3 Receiver Equalization Settings

Receiver Equalization	Equalization
0000 (Recommended)	Off
0010	Low
0110	Medium
1110	High

6.1.4 TRANSMITTER SWING

The PCI Express transmitters support implementations of both full voltage swing and half (low) voltage swing. In full swing signaling mode, the transmitters implement de-emphasis, while in half swing mode, the transmitters do not. The Transmitter Swing field in the PHY Parameter 2 Register (offset 858h, bit[30]) is used for the selection of full swing signaling or half swing signaling, which can be configured on a per-port basis via EEPROM or I2C settings.

Table 6-4 Transmitter Swing Settings

Transmitter Swing	Mode	De-emphasis
0	Full Voltage Swing	Implemented
1	Half Voltage Swing	Not implemented

6.1.5 DRIVE AMPLITUDE AND DE-EMPHASIS SETTINGS

Depending on the operation condition (voltage swing and de-emphasis condition), one of the Drive Amplitude Base Level fields in the PHY Parameter 0 Register (offset 8B0h) and one of the Drive De-Emphasis Base Level fields in the PHY Parameter 1 Register (offset 854h) are active for configuration of the amplitude and de-emphasis.

In addition, optional offset values can be added to the drive amplitude and drive de-emphasis on a per-port basis via EEPROM settings. The final drive amplitude and drive de-emphasis are the summation of the base level value and the offset value. The offset value for drive amplitude is 25 mV pd, and 6.25 mV pd for drive de-emphasis.

The driver output waveform is the synthesis of amplitude and de-emphasis as shown in Figure 6-1. The driver amplitude without de-emphasis is specified as a peak differential voltage level (mVpd), and the driver de-emphasis modifies the driver amplitude.

Figure 6-1 Driver Output Waveform

6.1.6 DRIVE AMPLITUDE

Only one of the Drive Amplitude Level field in the PHY Parameter 0 Register (offset 8B0h, bit[20:16], bit[25:21] and bit[30:26]) listed in Table 6-5 is active depending on the de-emphasis and swing condition. The settings and the corresponding values of the amplitude level are listed in Table 6-6, which can be configured by EEPROM or I2C settings.

Table 6-5 Drive Amplitude Base Level Registers

Active Register	De-Emphasis Condition	Swing Condition
Drive Amplitude Level (3P5 Nom)	-3.5 db	Full
Drive Amplitude Level (6P0 Nom)	-6.0 db	Full
Drive Amplitude Level (Half)	N/A	Half

1. Nominal levels. Actual levels will vary with temperature, voltage and board effects.
2. The maximum nominal amplitude of the output driver is 475 mV pd. Combined values of driver amplitude and de-emphasis greater than 475 mV pd should be avoided.
3. At higher amplitudes, actual swings will be less than the theoretical value due to process variations and environment factors, such as voltage overhead compression, package losses, board losses, and other effects.

6.1.7 DRIVE DE-EMPHASIS

The Drive De-Emphasis Level field in the PHY Parameter 1 Register (offset 854h, bit[20:16], bit[25:21] and bit[30:26]) listed in Table 6-7 controls the de-emphasis base level. The settings and the corresponding values of the de-emphasis level are listed in Table 6-8, which can be configured by EEPROM or I2C settings.

6.1.8 TRANSMITTER ELECTRICAL IDLE LATENCY

After the last character of the PCI Express transmission, the output current is reduced, and a differential voltage of less than 20 mV with common mode of VTX-CM-DC is established within 20 UI. This delay time is programmable via Transmitter PHY Latency field in the PHY Parameter 2 Register (offset 858h, bit[3:0]), which can be configured by EEPROM or I2C settings.

6.2 DATA LINK LAYER (DLL)

The Data Link Layer (DLL) provides a reliable data transmission between two PCI Express points. An ACK/NACK protocol is employed to guarantee the integrity of the packets delivered. Each Transaction Layer Packet (TLP) is protected by a 32-bit LCRC for error detection. The DLL receiver performs LCRC calculation to determine if the incoming packet is corrupted in the serial link. If an LCRC error is found, the DLL transmitter would issue a NACK data link layer packet (DLLP) to the opposite end to request a re-transmission, otherwise an ACK DLLP would be sent out to acknowledge on reception of a good TLP.

In the transmitter, a retry buffer is implemented to store the transmitted TLPs whose corresponding ACK/NACK DLLP have not been received yet. When an ACK is received, the TLPs with sequence number equals to and smaller than that carried in the ACK would be flushed out from the buffer. If a NACK is received or no ACK/NACK is returned from the link partner

after the replay timer expires, then a replay mechanism built in DLL transmitter is triggered to re-transmit the corresponding packet that receives NACK or time-out and any other TLP transmitted after that packet.

Meanwhile, the DLL is also responsible for the initialization, updating, and monitoring of the flow-control credit. All of the flow control information is carried by DLLP to the other end of the link. Unlike TLP, DLLP is guarded by 16-bit CRC to detect if data corruption occurs.

In addition, the Media Access Control (MAC) block, which is consisted of LTSSM, multiple lanes de-skew, scrambler/de-scrambler, clock correction from inserting skip order-set, and PIPE-related control/status circuits, is implemented to interface physical layer with data link layer.

6.3 TRANSACTION LAYER RECEIVE BLOCK (TLP DECAPSULATION)

The receiving end of the transaction layer performs header information retrieval and TC/VC mapping (see section 5.5), and it validates the correctness of the transaction type and format. If the TLP is found to contain an illegal header or the indicated packet length mismatches with the actual packet length, then a Malformed TLP is reported as an error associated with the receiving port. To ensure end-to-end data integrity, a 32-bit ECRC is checked against the TLP at the receiver if the digest bit is set in header.

6.4 ROUTING

The transaction layer implements three types of routing protocols: ID-based, address-based, and implicit routing. For configuration reads, configuration writes, transaction completion, and user-defined messages, the packets are routed by their destination ID constituted of bus number, device number, and function number. Address routing is employed to forward I/O or memory transactions to the destination port, which is located within the address range indicated by the address field carried in the packet header. The packet header indicates the packet types including memory read, memory write, IO read, IO write, Message Signaling Interrupt (MSI) and user-defined message. Implicit routing is mainly used to forward system message transactions such as virtual interrupt line, power management, and so on. The message type embedded in the packet header determines the routing mechanism.

If the incoming packet cannot be forwarded to any other port due to a miss to hit the defined address range or targeted ID, this is considered as Unsupported Request (UR) packet, which is similar to a master abort event in PCI protocol.

6.5 TC/VC MAPPING

The 3-bit TC field defined in the header identifies the traffic class of the incoming packets. To enable the differential service, a TC/VC mapping table at destination port that is pre-programmed by system software or EEPROM pre-load is utilized to cast the TC labeled packets into the desired virtual channel. Note that TC0 traffic is mapped into VC0 channel by default. After the TC/VC mapping, the receive block dispatches the incoming request, completion, or data into the appropriate VC0 and VC1 queues.

6.6 QUEUE

In PCI Express, it defines six different packet types to represent request, completion, and data. They are respectively Posted Request Header (PH), Posted Request Data payload (PD), Non-Posted Request Header (NPH), Non-Posted Data Payload (NPD), Completion Header (CPLH) and Completion Data payload (CPLD). Each packet with different type would be put into a separate queue in order to facilitate the following ordering processor. Since NPD usually contains one DW, it can be merged with the corresponding NPH into a common queue named NPHD. Except NPHD, each virtual channel (VC0 or VC1)

has its own corresponding packet header and data queue. When only VC0 is needed in some applications, VC1 can be disabled and its resources assigned to VC0 by asserting VC1_EN (Virtual Channel 1 Enable) to low.

6.6.1 PH

PH queue provides TLP header spaces for posted memory writes and various message request headers. Each header space occupies sixteen bytes to accommodate 3 DW or 4 DW headers. There are two PH queues for VC0 and VC1 respectively.

6.6.2 PD

PD queue is used for storing posted request data. If the received TLP is of the posted request type and is determined to have payload coming with the header, the payload data would be put into PD queue. There are two PD queues for VC0 and VC1 respectively.

6.6.3 NPHD

NPHD queue provides TLP header spaces for non-posted request packets, which include memory read, IO read, IO write, configuration read, and configuration write. Each header space takes twenty bytes to accommodate a 3-DW header, s 4-DW header, s 3-WD header with 1-DW data, and a 4-DW header with 1-DW data. There is only one NPHD queue for VC0, since non-posted request cannot be mapped into VC1.

6.6.4 CPLH

CPLH queue provides TLP header space for completion packets. Each header space takes twelve bytes to accommodate a 3-DW header. Please note that there are no 4-DW completion headers. There are two CPLH queues for VC0 and VC1 respectively.

6.6.5 CPLD

CPLD queue is used for storing completion data. If the received TLP is of the completion type and is determined to have payload coming with the header, the payload data would be put into CPLD queue. There are two CPLD queues for VC0 and VC1 respectively.

6.7 TRANSACTION ORDERING

Within a VPPB, a set of ordering rules is defined to regulate the transactions on the PCI Express Switch including Memory, IO, Configuration and Messages, in order to avoid deadlocks and to support the Producer-Consumer model. The ordering rules defined in table 6-9 apply within a single Traffic Class (TC). There is no ordering requirement among transactions within different TC labels. Since the transactions with the same TC label are not allowed to map into different virtual channels, it implies no ordering relationship between the traffic in VC0 and VC1.

Table 6-9 Summary of PCI Express Ordering Rules

Row Pass Column	Posted Request	Read Request	Non-posted Write Request	Read Completion	Non-posted Write Completion
Posted Request	Yes/No ¹	Yes ⁵	Yes ⁵	Yes ⁵	Yes ⁵

Row Pass Column	Posted Request	Read Request	Non-posted Write Request	Read Completion	Non-posted Write Completion
Read Request	No ²	Yes	Yes	Yes	Yes
Non-posted Write Request	No ²	Yes	Yes	Yes	Yes
Read Completion	Yes/No ³	Yes	Yes	Yes	Yes
Non-Posted Write Completion	Yes ⁴	Yes	Yes	Yes	Yes

1. When the Relaxed Ordering Attribute bit is cleared, the Posted Request transactions including memory write and message request must complete on the egress bus of VPPB in the order in which they are received on the ingress bus of VPPB. If the Relaxed Ordering Attribute bit is set, the Posted Request is permitted to pass over other Posted Requests occurring before it.
2. A Read Request transmitting in the same direction as a previously queued Posted Request transaction must push the posted write data ahead of it. The Posted Request transaction must complete on the egress bus before the Read Request can be attempted on the egress bus. The Read transaction can go to the same location as the Posted data. Therefore, if the Read transaction were to pass the Posted transaction, it would return stale data.
3. When the Relaxed Ordering Attribute bit is cleared, a Read completion must “pull” ahead of previously queued posted data transmitting in the same direction. In this case, the read data transmits in the same direction as the posted data, and the requestor of the read transaction is on the same side of the VPPB as the completer of the posted transaction. The posted transaction must deliver to the completer before the read data is returned to the requestor. If the Relaxed Ordering Attribute bit is set, then a read completion is permitted to pass a previously queued Memory Write or Message Request.
4. Non-Posted Write Completions are permitted to pass a previous Memory Write or Message Request transaction. Such transactions are actually transmitting in the opposite directions and hence have no ordering relationship.
5. Posted Request transactions must be given opportunities to pass Non-posted Read and Write Requests as well as Completions. Otherwise, deadlocks may occur when some older bridges, which do not support delayed transactions are mixed with PCIe Switch in the same system. A fairness algorithm is used to arbitrate between the Posted Write queue and the Non-posted transaction queue

6.8 PORT ARBITRATION

Among multiple ingress ports, the port arbitration built in the egress port determines which incoming packets to be forwarded to the output port. The arbitration algorithm contains hardware fixed Round Robin, 128-phase Weighted Round-Robin and programmable 128-phase time-based WRR. The port arbitration is held within the same VC channel. It means that each port has two port arbitration circuitries for VC0 and VC1 respectively. At the upstream ports, in addition to the inter-port packets, the intra-port packet such as configurations completion would also join the arbitration loop to get the service from Virtual Channel 0.

6.9 VC ARBITRATION

After port arbitration, VC arbitration is executed among different VC channels within the same source. Three arbitration algorithms are provided to choose the appropriate VC: Strict Priority, Round Robin or Weighted Round Robin.

6.10 FLOW CONTROL

PCI Express employs Credit-Based Flow Control mechanism to make buffer utilization more efficient. The transaction layer transmitter ensures that it does not transmit a TLP to an opposite receiver unless the receiver has enough buffer space to accept the TLP. The transaction layer receiver has the responsibility to advertise the free buffer space to an opposite transmitter to avoid packet stale. In this Switch, each port has its own separate queues for different traffic types and the

credits are sent to data link layer on the fly. The data link layer compares the current available credits with the monitored ones and reports the updated credit to the counterpart. If no new credit is acquired, the credit reported is scheduled for every 30 us to prevent the link from entering retrain. On the other hand, the receiver at each egress port gets the usable credits from the opposite end in a link. The output port broadcasts them to all the other ingress ports to get packet transmission.

6.11 TRANSACTION LAYER TRANSMIT BLOCK (TLP ENCAPSULATION)

The transmit portion of transaction layer performs the following functions. They construct the all types of forwarded TLP generated from VC arbiter, respond with the completion packets when the local resource (i.e. configuration register) is accessed, and regenerate the message that terminates at receiver to RC if acting as an upstream port.

6.12 Non-Transparent Bridging (NT Mode Only)

Non-Transparent Bridging function translates Memory Address of the processor, and allows the process to appear as an endpoint. This function allows two separate Hosts to be connected together in a multi-host system, such as a multi-processor server or a control module with a built-in processor. Transactions in Base Address Space between two independent Address Spaces are translated and forwarded to each other.

When NT mode is enabled, one of the ports of the packet switch can be programmed to enter NT mode. While the port is in NT mode, the packet switch allows the isolation of address spaces, and the packet switch acts as an endpoint to the Host. The packet switch in NT mode terminates Type 0 Configuration Register packet. All incoming and outgoing memory-type transaction addresses are translated and forwarded from one domain to another using Base Address Registers (BARs). And the routing ID of the transaction packet is also translated between two host domains.

Registers that are used to notify the system of interrupts are called Interrupts Request (IRQ) registers. Messaging between processor domains achieved through the use of Scratchpad Registers, which both processors from separate process domains can access.

Only one port of the packet switch can be configured to operate in NT mode. NT mode is enabled and disabled by toggling the NT_ENABLE_L strapping pin.

6.12.1 Device Type Identification

The packet switch uses the Class Code Register (Offset 08h) in PCI Configuration Space Registers to identify its own Bridge Class type, and uses the PCI Express Capability register's Device/Port Type field (Offset 68h) to indicate the device/port type.

In Transparent Mode, the Class Code register returns the value 060400h to identify the packet switch as a PCI-to-PCI Bridge. The Device/Port Type field of the PCI Express Capability register (Offset 68h, bits [23:30]) returns 5h at upstream port and 6h at downstream port.

In Non-Transparent Mode, the Class Code register returns the value 068000h to identify the packet switch as an Other Bridge. The Device/Port Type field of the PCI Express Capability register returns 0h to indicate that it is a PCI Express endpoint device.

6.12.2 Intelligent Adaptor

The packet switch supports intelligent adaptor model in NT mode for multi-host systems. The model is implemented in PCI Express specification as in the established PCI specification. The NT bridge implements two Type 0 CSR Headers: Link

Interface and Virtual Interface. NT Port's Link Interface is connected to the System Host, and the Virtual Interface is connected to the internal virtual PCI bus.

In a multi-host system, the Local Host controls all Transparent Port Type 1 and NT Port Virtual Interface Type 0 functions, and the System Host controls only the NT Port Link Interface Type 0 function. The Address Translation between Link Interface and Virtual Interface routes Packets across the Host Domains.

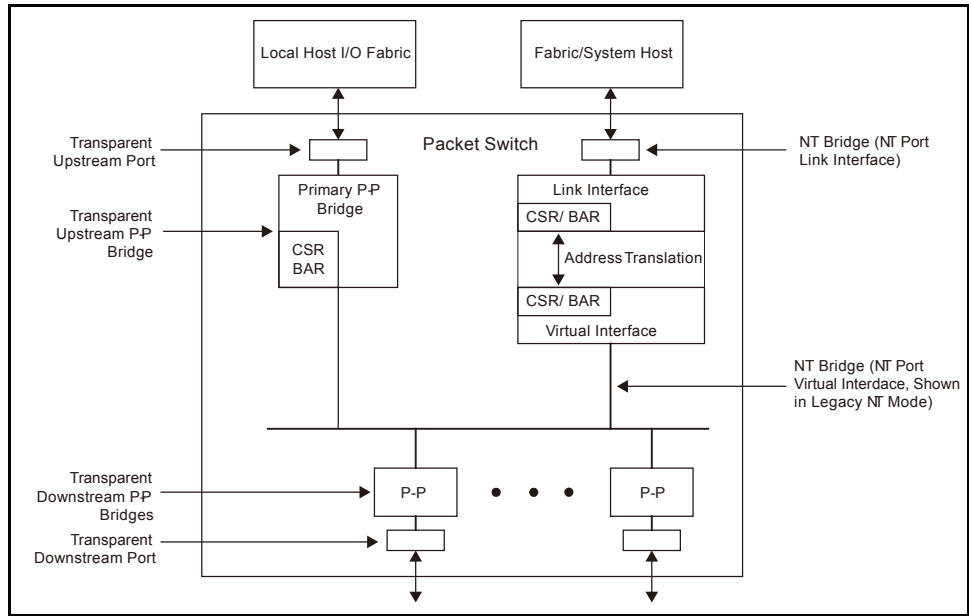

Figure 6-2 Intelligent Adaptor Architecture

6.12.3 Interrupts Request (IRQ) Registers

The Interrupts Request (IRQ) register sets are used to provide interrupt mechanism across the Non-Transparent port of the packet switch. The registers provide 16-bit interrupts signals in Virtual Interface and Link Interfaces through the following registers.

- Virtual Interface IRQ Set register (Offset C4Ch)
- Virtual Interface IRQ Clear register (Offset C50h)
- Virtual Interface IRQ Mask Set register (Offset C54h)
- Virtual Interface IRQ Mask Clear register (Offset C58h)
- Link Interface IRQ Set register (Offset C5Ch)
- Link Interface IRQ Clear register (Offset C60h)
- Link Interface IRQ Mask Set register (Offset C64h)
- Link Interface IRQ Mask Clear register (Offset C68h)

User software sets one or more bits of the Virtual or Link Interface IRQ Set register to signal that an interrupt is asserted on the Virtual or Link Interface of the Non-Transparent port. When bits of the IRQ Set register are set, the corresponding Mask Set register bits are cleared at the same time. User software sets one or more bits of the Virtual or Link Interface IRQ Clear register to signal that an interrupt is de-asserted on the Virtual or Link Interface of the Non-Transparent port. When bits of the IRQ Clear register are set, the corresponding Mask Clear register bits are cleared at the same time.

6.12.4 Scratchpad Registers

Hosts from both side of the Non-Transparent port of the packet switch are able to exchange messages through the implementation of the Scratchpad registers. These registers are readable and writable from both sides, and they provide a mechanism for inter-host communication of Control and Status information, or can be used as generic RW registers. Eight 32-bit register blocks (offset C6Ch to C8Bh) are allocated for Scratchpad registers.

6.12.5 NT Base Address Registers

The Base Address registers (BARs) are implemented to perform address translation in Memory-Map access. One set of BARs is used for Virtual Interface and one set of BARs for Link Interface. The BARs sets up the window size and type and defines the translation address.

BAR0 and BAR1 enable and disable and set up the Memory-Map access to NT-Port Configuration register space. BAR2, BAR3, BAR4, and BAR5 enable and disable and set up the access to other side of the NT-Port.

The BARs is enabled and disabled as indicated in the Memory Space Indicator bits. 32-bit and 64-bit memory window space is supported as indicated in the Memory Map Type bits. The Memory Base Address for memory-mapping is configured in the Base Address bits.

6.12.6 Routing ID Translation

The header of transaction layer packet contains Requester ID and/or Completer ID. The Requester/Completer ID is made up by bus number, device number and function number, and is also called the Routing ID. The routing ID represents a unique resource allocated to the device in a host domain. Since each host in different domain assigns routing ID independently, Routing ID translation is necessary for packets that transverse between link and virtual interface. The Virtual Port Registers (Offset D94h-DF3h) are implemented to support the translation of Routing ID between host domains using lookup tables.

6.13 Integrated DMA Engine

The packet switch has built-in Direct Memory Access (DMA) engine to transfer data between two memory locations. Two DMA engines are implemented for each of the upstream port (DMA_UP) and Non-Transparent port (DMA_NT). Each DMA engine supports two channels: Channel 0 and Channel 1.

Data transfer in the main CPU Memory Address domain is managed by DMA_UP engine while DMA_NT assists DMA_UP to manage data transfer across main and slave CPU Memory Address domains. Then DMA engines support both 32-bit and 64-bit Memory Address domains.

The DMA engine uses a 20-byte descriptor in 64-bit address domain to hold 64-bit source address and 64-bit destination address, 24-bit transfer size and 8-bit control/status bits. The DMA engine uses a 12-byte descriptor in 32-bit address domain to hold 32-bit source address and 32-bit destination address, 24-bit transfer size and 8-bit control/status bits.

The DMA engine supports prefetching function. Each channel of the DMA_UP and DMA_NT engines is capable of prefetching up to eight descriptors in 64-bit addressing mode and up to twelve descriptors in 32-bit addressing mode. Total of 128 descriptors are supported and can be shared in flexible configurations. Both the hardware and software have simultaneous access to the built-in Descriptor Ownership register simultaneously to prevent hardware descriptor status write-back.

Figure 6-3 Block Diagram of Integrated DMA Engines in Packet Switch

The features of the packet switch’s DMA engines are listed below:

- Two DMA engines are implemented for upstream port (DMA_UP) and non-transparent port (DMA_NT)
- Each DMA engine supports two channels: Channel 0 and Channel 1
- DMA_UP manages the data transfer in main CPU address domain
- DMA_NT assists DMA_UP to manage data transfer across main and slave CPU address domains
- Supports 64-bit addressing domain
- 20-byte descriptor in 64-bit address domain
 - Holds 64-bit source address and 64-bit destination address
 - Holds 24-bit transfer size and 8-bit control/status bits
- 12-byte descriptor in 32-bit address domain
 - Holds 32-bit source address and 32-bit destination address
 - Holds 24-bit transfer size and 8-bit control/status bits
- Each channel of DMA_UP and DMA_NT engines is capable of prefetching
 - Up to 8 descriptors in 64-bit addressing mode
 - Up to 12 descriptors in 32-bit addressing mode
- Supports total of 128 descriptors shared by two channels in flexible configurations

Built-in Descriptors Ownership register is accessed by hardware and software simultaneously to prevent hardware descriptor status write-back.

6.13.1 Data Structure

The DMA descriptors reside in system memory, and they are structured in a ring configuration (see Figure below). The DMA engine fetches the descriptor pointer which points to the next available descriptor. The pointer in DMA engine is continuously advanced. When the last descriptor is reached, the pointer automatically jumps back to the first descriptor in the ring structure.

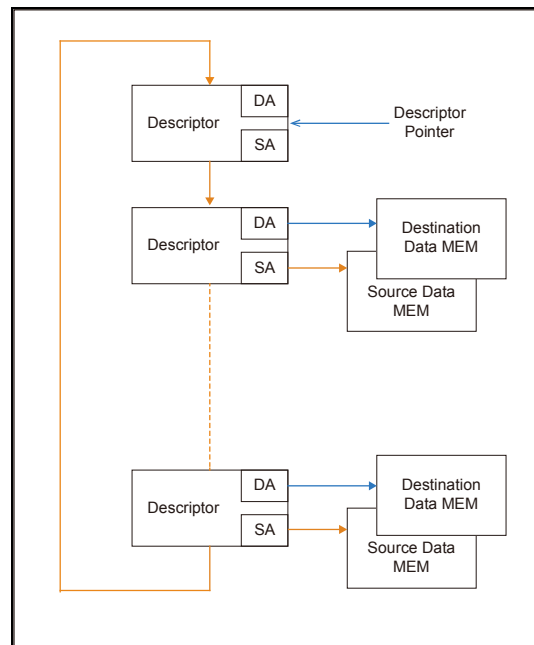

Figure 6-4 DMA Descriptor Ring Structure

DMA_UP engine’s descriptor holds two data pointers, which point to the addresses of source and destination memory blocks. The data are transferred from source to destination memory location as indicated by the addresses indicated by data pointers in the descriptors. In contrast, DMA_NT engine holds only one data pointer, which points to the source or destination location memory block, depending on the DMA traffic direction.

The tables below define the descriptor’s data structure in 32-bit and 64-bit systems.

6.13.2 Traffic Models

The primary purpose of the DMA engine is to alleviate the workload of CPU to transfer of data from one memory location to another. The DMA engine of the Packet Switch supports the following three data transfer models.

Device-to-Processor Traffic Model

If DMA engines are not implemented, the Device-to-Processor Traffic requires a host CPU to issue read/write commands, transfer data, and process status information reported by the downstream devices. When DMA engines are implemented, they execute the process of data transfer and offload the CPU's tasks. In this traffic model, only the DMA_UP engine is enabled. The source address points to the downstream device's memory location and the destination address points to the main memory location. The figure below illustrates the Device-to-Processor Traffic model and the associated descriptor's data structure.

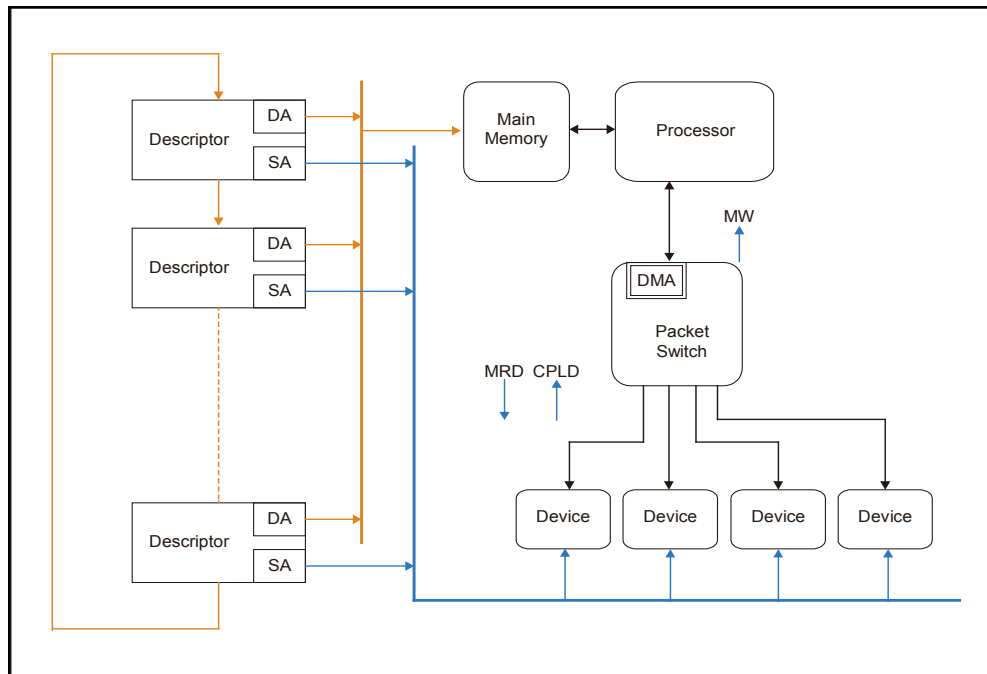

Figure 6-7 Status Information Collection Traffic Model

Peer-to-Peer Traffic Model

In Peer-to-Peer Traffic model, data transfer takes place between the downstream ports. Only the DMA_UP engine is enabled in this traffic model. The DMA_UP engine initiates and executes data transfer between two devices connected to the downstream ports without CPU's intervention. The source address in the description points to one device's memory location and the destination address points to another device's. The data are read from the source device and written to the destination device directly. The figure below illustrates the Peer-to-Peer Traffic model and the associated descriptor's data structure.

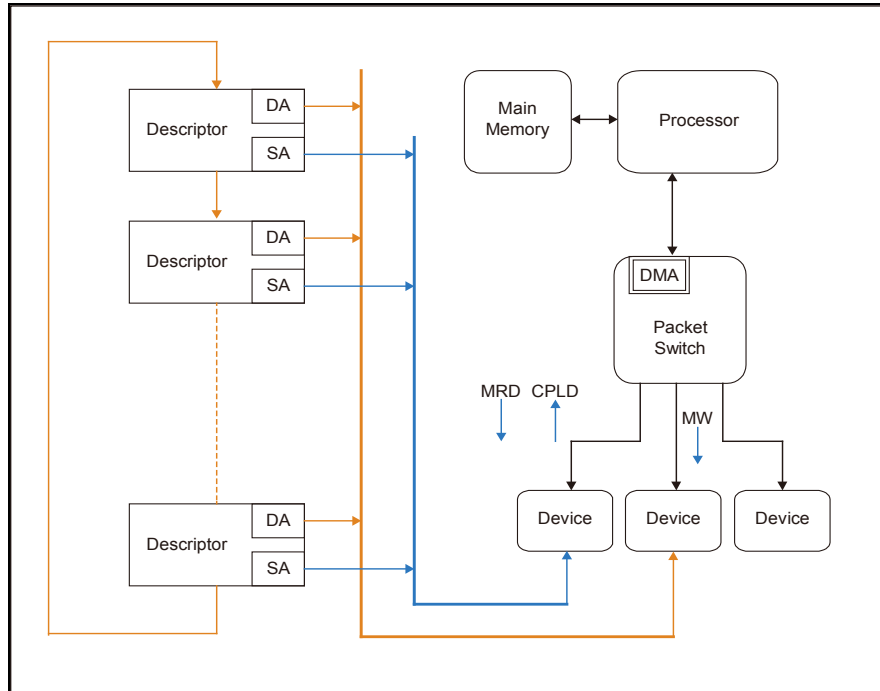

Figure 6-8 Peer-to-Peer Transfer Traffic Model

Inter-processor / Downstream Port to NT Port Traffic Model

In a multi-process application, data is routed from a downstream port to a NT port. The data traffic across processor domains typically consumes a large amount of CPU resources if DMA engines are not implemented. The CPU is responsible for issuing and executing read and write commands to transfer data. The DMA engine in the packet switch is implemented to offload the workload of CPU and move data from one processor domain to another on the behalf of CPU. In inter-processor traffic model, both of the DMA_UP and DMA_NT DMA engines are enabled at the same time to maintain their own descriptor data structures in different memory spaces.

In this traffic model, only one of the source or destination addresses in DMA_UP descriptor is valid, depending on the direction of the traffic. If DMA_UP engine is in the process of receiving data, only the destination address is valid. If DMA_UP engine is in the process of transmitting data, only the source address is valid. The DMA_NT engine’s descriptor is used only for the purpose of validating the source pointer, which points to the location of data buffer. The DMA_NT descriptor also defines the SAV and DAV bits to determine the direction of the data traffic. The figure below illustrates the Inter-processor Traffic model and the associated descriptor’s data structure.

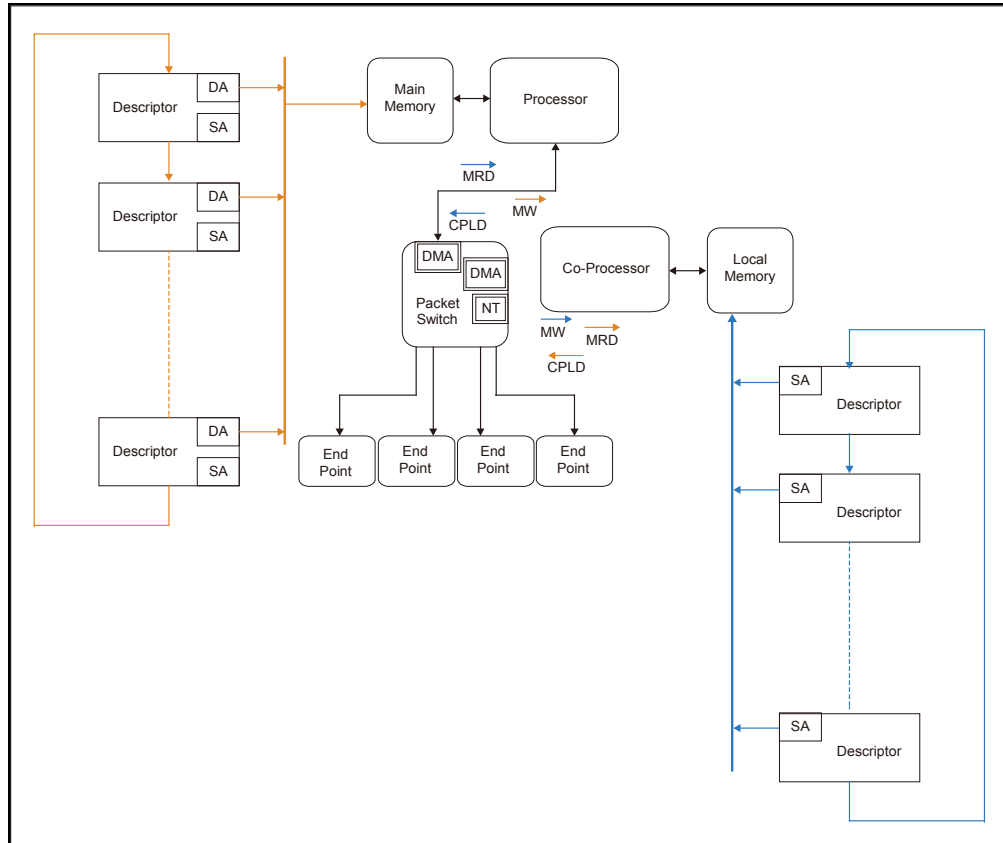

Figure 6-9 Inter-processor / Downstream Port to NT Port Traffic Model

6.13.3 Data Transfer Sequence

DMA engine moves data from one location to another without CPU's intervention. The CPU sets up DMA descriptor and initializes the DMA, and then is freed to perform other processes until it is interrupted to check the transfer status and to refresh the data content.

A typical DMA_UP engine operation sequence and its interaction with CPU and packet switch are described below.

1. CPU initializes the descriptor data structure in main memory.
2. CPU writes all "1" to the on-chip descriptor ownership register to notify DMA_UP engine the availability of descriptors.
3. CPU starts DMA_UP engine.
4. DMA pre-fetches 1 to 32 descriptors.
5. DMA starts processing the descriptors.
6. DMA issues read command to get data from the source location.
7. Completion data (CPLD) arrives at packet switch.
8. Packet switch converts CPLD into Post-Write data packet.
9. DMA issues write command to transmit data to the destination location.
10. More than one iteration from step 6 to step 9 may be required to complete transfer of one descriptor depending on the PCIe max read size, PCIe max payload size and whether the 4K boundary was crossed.
11. After finishing transfer of descriptor, the DMA clears the corresponding descriptor bit in the ownership register and interrupts CPU if INT bit is "1".

12. DMA_UP engine proceeds to the next descriptor and repeats the step 5 to 11.
13. CPU receives and processes interrupts, and then writes “1” to the corresponding bit of the processed descriptor in the ownership register if needed.
14. DMA_UP engine continuously polls the status of Channel X descriptor ownership register and pre-fetches the available descriptors depending on the setting of Channel X prefetch upper limit register.
15. If the EOT bit is set in the last processed descriptor, the data transfer is done. The transfer count will be updated by hardware. The count indicates the number of bytes moved in the last descriptor of a data transfer.

Note – Destination descriptor does not to set EOT. Only DMA sets EOT and updates byte count.

Both of DMA_UP and DMA_NT engines are involved to process inter-processor data transfer. The operation sequence of data moving from local CPU domain to main CPU domain and their interactions with local/main CPUs and packet switch are described below. The descriptor number and transfer size of descriptor are not necessary the same for DMA_UP and DMA_NT.

1. Main CPU and local CPU initialize the descriptors in main memory and local memory respectively.
2. Both CPUs write all “1” to their on-chip descriptor ownership registers to notify DMA_UP and DMA_NT engines the availability of descriptors.
3. Both CPUs start their own DMA engines.
4. DMA_UP and DMA_NT fetch their own 1 to 32 descriptors in advance.
5. DMA_NT and DMA_UP begin to process their own descriptors.
6. DMA_NT issues read command to get data from the source location pointed by SA address in DMA_NT descriptor.
7. Completion data (CPLD) arrives at the NT port of packet switch.
8. Packet switch converts CPLD into Post-Write data packet in packet switch.
9. DMA issues write command to send data to the destination location pointed by DA address in DMA_UP descriptor.
10. More than one iteration from step 6 to step 9 may be required to complete transfer of one descriptor depending on the PCIe max read size, PCIe max payload size and whether the 4K boundary was crossed.
11. After finishing the transfer process of descriptor, the DMA_NT or/and DMA_UP clears the corresponding descriptor bit in the ownership register and interrupts local CPU or/and main CPU if INT bit is “1”.
12. DMA_NT or/and DMA_UP proceed to their own next descriptor and repeat step 5 to 11.
13. Main or local CPU receives and processes interrupts, and then writes “1” to the corresponding bit of processed descriptor in the ownership register if needed.
14. DMA_UP or DMA_NT engine continuously polls the status of Channel X descriptor ownership register and prefetches the available descriptors depending on the setting of Channel X prefetch upper limit register.
15. If the EOT bit is set in the last processed descriptor of DMA_NT, the data transfer is done. The transfer count will be updated by hardware to the descriptor of DMA_UP. The count indicates the remaining bytes moved in the last descriptor of a data transfer. EOT bit will also be set by hardware to notify the software of main CPU the completion of current transfer

The operation sequence repeats through the ring of descriptors if not paused or aborted by CPU. The software is allowed to stop the DMA engine's operation. The software may stop the DMA engines to re-synchronize the event handling of software and hardware under certain conditions. The DMA transfer may be aborted for other reasons, such as when transfer of large amount of data is no longer required.

6.13.4 DMA Pause

The DMA engine can be paused by setting the “Pause” bit in the Channel X Control/Status Register. After the DMA engine is paused, the DMA engine completes the operation with the current active descriptors. After the completion of the current active descriptors, no descriptors will be processed and prefetched. The “Pause Done” bit in the Channel X Control/Status register will be set, and this will trigger an interrupt to the CPU, indicating that the pause action is completed. At this point, the system software may check the descriptor's ownership status register to determine the progress of the DMA transfer. The

software may clear both of the “Pause Done” and “Pause Control” bits of Channel X Control/Status register to resume DMA operation from the paused status.

6.13.5 DMA Abort

The DMA engine can be aborted by writing “1” to the “Abort” bit in the Channel X Control/Status register. After the DMA operation is aborted, the DMA engine drops the current active descriptor, flushes out all outstanding read commands, and discards all received completion data. After DMA engine drops the active descriptor, no more descriptors are processed and prefetched. The descriptor ownership registers are reset, and the ownership of all descriptors is assigned to the software. Then, the “Abort Done” bit in the Channel X Control/Status register is set to indicate the completion of abort action. The software may examine the descriptor ownership and transfer count status registers to determine the progress of the DMA aborted transfer and the number of the bytes that were transferred. The software may clear both of the “Abort Done” and “Abort Control” bits of Channel X Control/Status register to exit the DMA engine from Abort state. And then the software may attempt to start a new transfer from the current descriptor pointer.

6.13.6 DMA Stop

The DMA engine can be stopped by re-setting the “Start” bit in the Channel X Control/Status register. After the DMA operation is stopped, the current pointer is set to the descriptor ring base pointer. And the DMA engine flushes out all outstanding read commands and discards all completion data that were received. The DMA engine stops processing and prefetching any descriptors. The descriptor ownership registers are reset, and the ownership of all descriptors is assigned to the software. After the DMA engine is stopped, software is free to re-configure the channel mode, descriptor base pointer, and the number of descriptors in order to initialize new data transfers.

6.13.7 Descriptor Prefetch

The DMA engine implements the Descriptor Prefetch function to maximize the channel bandwidth usage. The Descriptor Prefetch function ensures that DMA engine never runs out of descriptors and lower the chance of having to wait for descriptors to arrive from memory in the process of data transfer. Each channel of both DMA engines can store up to 8 descriptors in 64-bit addressing system or 12 descriptors in 32-bit addressing system. The initial descriptor prefetch fills up the descriptor FIFO of each channel to reduce descriptor reading overhead. The prefetch upper limit should never exceed the descriptor ring size, or some of descriptors in descriptor ring will be fetched twice. After the first prefetch is completed, the DMA engine keeps polling the availability of descriptors, which are indicated in Channel X descriptor ownership register.

If new descriptors are found, the DMA engine will prefetch descriptors based on the setting of Channel X prefetch upper limit register. If the end of descriptor ring is reached, the DMA engine stops the read request for descriptors at the end of ring, and issues another read request, which starts at the descriptor ring base pointer.

6.14 Hot Plug Support

Note: *In this chapter, unless stated otherwise, “Hot Plug Controller” reference both the Parallel and Serial Hot Plug Controllers.*

Hot Plug capability allows board insertion and removal from a running system, without adversely affecting the system. Boards are typically inserted or removed to repair faulty boards or re-configure the system without system down time. Hot Plug capability allows systems to isolate faulty boards in the events of a failure.

Diodes PI7C9X2G1224GP can support three sets of 10 Hot Plug signals that can be associated to any three Transparent downstream Ports to implement Hot Plug function. If more than three Ports require Hot Plug signals, the additional Ports can use an external I2C I/O Expander (16-bit Diodes PI4IOE5V9555 per slot or 40-bit NXP PCA9698 per two slots), to provide the external signals.

Hot Plug signals are enabled, configured, and accessed through the **Slot Capability** and **Slot Status and Control** registers (offsets 7Ch and 80h, respectively), in each Port. Also, each Port's **Power Management Hot Plug User Configuration** register (offset 1E0h) provides additional Device-Specific configuration and control, for both Parallel and Serial Hot Plug implementations.

6.14.1 Hot Plug Controller Slot Power-Up/Down Sequence

If a Hot Plug-capable Transparent downstream Port is enabled, the Port's Hot Plug Controller can power-up that slot. This section describes how this process occurs.

6.14.1.1 Slot Power-Up Sequence

If a Hot Plug-capable Transparent downstream Port is connected to a slot, its associated Hot Plug Controller can power up that slot, with or without an external serial EEPROM. Hot Plug Controller sequencing is determined by the states of the following bits:

- **Slot Capability** register *Power Controller Present* bit (offset 7Ch[1])
- **Slot Capability** register *MRL Sensor Present* bit (offset 7Ch[2])
- **Slot Control** register *Power Controller Control* bit (offset 80h[10])

And the HP_MRL_x_L input state, if the *MRL Sensor Present* bit is Set. Hot Plug-configurable features are programmable only by the serial EEPROM and/or I²C.

Figure 6-10 Slot Power-Up Timing When Power Controller Present Bit Is Set

6.14.1.2 Slot Power-Down Sequence

Software can power-down slots by Setting the *Power Controller Control* bit (offset 80h[10]). If the *MRL sensor Present* bit (offset 7Ch[2]) is Set, the Hot Plug Controller automatically powers down the slot if the MRL is open. Figure 6-11 illustrates the following power-down timing sequence for either event:

1. HP_PERST_x_L to the Port is asserted.

2. HP_CLKEN_x_L is de-asserted to the slot 100µs after HP_PERST_x_L is asserted.
3. HP_PWREN_x is de-asserted to the slot 100µs after HP_CLKEN_x_L is de-asserted.

7 EEPROM INTERFACE AND I2C BUS

7.1 EEPROM INTERFACE

The EEPROM interface consists of four pins: EECK (EEPROM clock), EEDI (EEPROM serial data input), EEDO (EEPROM serial data output) and EECS (EEPROM chip select). The Switch supports 2-, or 3-byte address SPI EEPROM parts and automatically determines the appropriate addressing mode. The EEPROM is used to initialize a number of registers before enumeration. This is accomplished after PERST# is de-asserted, at which time the data from the EEPROM is loaded. The EEPROM interface is organized into a 16-bit base, and the Switch supplies an 8-bit EEPROM word address.

7.1.1 AUTO MODE EEPROM ACCESS

The Switch may access the EEPROM in a WORD format by utilizing the auto mode through a hardware sequencer. The EEPROM start-control, address, and read/write commands can be accessed through the configuration register. Before each access, the software should check the Autoload Status bit before issuing the next start.

7.1.2 EEPROM MODE AT RESET

During a reset, the Switch will automatically load the information/data from the EEPROM if the automatic load condition is met. The first offset in the EEPROM contains a signature. If the signature is recognized, the autoloading initiates right after the reset.

During the autoloading, the Bridge will read sequential words from the EEPROM and write to the appropriate registers. Before the Bridge registers can be accessed through the host, the autoloading condition should be verified by reading bit [4] offset 87Ch (EEPROM Autoload Status). The host access is allowed only after the status of this bit is set to '1' which indicates that the autoloading initialization sequence is complete.

7.2 SMBUS INTERFACE

The Packet Switch provides the System Management Bus (SMBus), a two-wire interface through which a simple device can communicate with the rest of the system. The SMBus interface on the Packet Switch is a bi-directional slave interface. It can receive data from the SMBus master or send data to the master. The interface allows full access to the configuration registers. A SMBus master, such as the processor or other SMBus devices, can read or write to every RW configuration register (read/write register). In addition, the RO and HwInt registers (read-only and hardware initialized registers) that can be auto-loaded by the EEPROM interface can also be read and written by the SMBus interface. This feature allows increases in the system expandability and flexibility in system implementation.

Figure 7-1 SMBus Architecture Implementation

The SMBus interface on the Packet Switch consists of one SMBus clock pin (SCL_I2C), a SMBus data pin (SDA_I2C), and 3 SMBus address pins (I2C_ADDR[2:0]). The SMBus clock pin provides or receives the clock signal. The SMBus data pin facilitates the data transmission and reception. Both of the clock and data pins are bi-directional. The SMBus address pins determine the address to which the Packet Switch responds to. The SMBus address pins generate addresses according to the following table:

Table 7-1 SMBus Address Pin Configuration

BIT	SMBus Address
0	I2C_ADDR[0]
1	I2C_ADDR[1]
2	I2C_ADDR[2]
3	1
4	1
5	1
6	0

Software can change the SMBus Slave address, by programming the SMBus/I2C Control Register SMBus/I2C Device Address field.

The PI7C9X2G1224GP also supports Packet Error Checking and Packet Error Code (PEC) generation, as explained in the SMBus v2.0.

PI7C9X2G1224GP supports three commands:

- Block Write (command BEh) is used to write CFG registers
- Block Write (command BAh), followed by Block Read (command BDh), are used to read CFG registers
- Block Read - Block Write Process Call (commands BAh, CDh) can also be used to read CFG registers

7.2.1 SMBUS BLOCK WRITE

The Block Write command is used to write to the PI7C9X2G1224GP registers. General SMBus Block Writes are illustrated in Figure 7-2 and Figure 7-3. Table 7-2 explains the elements used in Figure 7-2 and Figure 7-3.

Figure 7-2 SMBus Block Write Command Format, to Write to a PI7C9X2G1224GP Register without PEC

Figure 7-3 SMBus Block Write Command Format, to Write to a PI7C9X2G1224GP Register with PEC

Block Write transactions that are received with incorrect Cmd Code are NACKed, starting from the wrong byte setting, and including subsequent bytes in the packet. For example, if the Byte Count value is not 8, the PI7C9X2G1224GP NACKs the byte corresponding to the Byte Count value, as well as any Data bytes following within the same packet.

The byte after Data Byte 4, if present, is taken as the PEC byte, and if present, the PEC is checked. If a packet fails Packet Error Checking, the PI7C9X2G1224GP drops the packet (ignores the Write), and returns NACK for the PEC byte, to the SMBus Master. Packet Error Checking can be disabled, by setting the SMBus/I²C Control Register PEC Check Disable bit. The Byte Count value, by definition, does not include the PEC byte.

7.2.2 SMBUS BLOCK READ

A Block Read command is used to read PI7C9X2G1224GP CFG registers. Similar to CFG register Reads using I²C, a SMBus Write sequence must first be performed to select the register to read, followed by a SMBus Read of the corresponding register. There are two ways a PI7C9X2G1224GP register can be read:

- Use a Block Write, followed by a Block Read. The Block Write sets up the parameters including Port Number, register address and Byte Enables, and the Block Read performs the actual Read operation.

- Use a Block Read - Block Write Process Call. This command is defined by the SMBus v2.0, and performs a Block Write and Block Read, using a single command. The Block Write portion of the message sets up the register to be read, and then a repeated START followed by the Block Read portion of the message returns the register data specified by the Block Write

The PI7C9X2G1224GP always NACKs any incorrect command sequences, starting with the wrong Byte. Upon receiving the Block Read command, the PI7C9X2G1224GP returns a PEC to the Master, if after the 4th byte of register data, the Master still requests one more Byte. As a Slave, the PI7C9X2G1224GP recognizes the end of the Master's Read cycle, by observing the Master's NACK response for the last Data Byte transmitted by the PI7C9X2G1224GP.

Incorrect command sequences are always NACK, starting with the byte that is incorrect. (Refer to Table 7-4.) On the Block Read command, a PEC is returned to the Master, if after the 4th byte of CSR data, the return Master still requests for one additional byte. As a Slave, the PI7C9X2G1224GP will know the end of the Master Read cycle, by observing the NACK for the last byte read from the Master.

7.2.3 CSR READ, USING SMBUS BLOCK READ – BLOCK WRITE PROCESS CALL

A general SMBus Block Read - Block Write Process Call sequence is illustrated in Figure 7-5. Alternatively, a general SMBus Block Read - Block Write Process Call with PEC sequence is illustrated in Figure 7-6.

Using this command, the register to be read can be set up and read back with one SMBus cycle (a transaction with a START and ending in STOP). There is no STOP condition before the repeated START condition. The command format for the Block Write part of this command has the same sequence as in Table 7-5, except that the Command Code changes to CDh, as illustrated below. Other Bytes remain the same as used in the sequence for SMBus Block Write followed by Block Read. Table 7-9 lists the Command format for Block Read.

7.3 I²C SLAVE INTERFACE

Inter-Integrated Circuit (I²C) is a bus used to connect Integrated Circuits (ICs). Multiple ICs can be connected to an I²C Bus, and I²C devices that have I²C mastering capability can initiate a Data transfer. I²C is used for Data transfers between ICs at relatively low rates (100 Kbps), and is used in a variety of applications. For further details regarding I²C Buses, refer to the *I²C Bus v2.1*.

The PI7C9X2G1224GP is an I²C Slave. Slave operations allow the PI7C9X2G1224GP Configuration registers to be read from or written to by an I²C Master, external from the device. I²C is a sideband mechanism that allows the device Configuration registers to be programmed, read from, or written to, independent of the PCI Express upstream Link.

Figure 7-7 Standard Devices to I²C Bus Connection Block Diagram

The I²C interface on the Packet Switch consists of a I²C clock pin (SCL_I2C), a I²C data pin (SDA_I2C), and 3 I²C address pins (I2C_ADDR[2:0]). The I²C clock pin provides or receives the clock signal. The I²C data pin facilitates the data transmission and reception. Both of the clock and data pins are bi-directional. The I²C address pins determine the address to which the Packet Switch responds to. The I²C address pins generate addresses according to the following table:

Table 7-10 I²C Address Pin Configuration

BIT	I2C Address
0	I2C_ADDR[0]
1	I2C_ADDR[1]
2	I2C_ADDR[2]
3	1
4	1
5	1
6	0

Software can change the I²C Slave address, by programming the I²C Control Register I²C Device Address field.

7.3.1 I²C REGISTER WRITE ACCESS

The PI7C9X2G1224GP Configuration registers can be read from and written to, based upon I²C register Read and Write operations, respectively. An I²C Write packet consists of Address Phase bytes and Command Phase bytes, followed by one to four additional I²C Data bytes. Table 7-11 defines mapping of the I²C Data bytes to the Configuration register Data bytes.

The I²C packet starts with the S (START condition) bit. Data bytes are separated by the A (Acknowledge Control Packet (ACK)) or N (Negative Acknowledge (NAK)) bit. The packet ends with the P (STOP condition) bit.

If the Master generates an invalid command, the targeted PI7C9X2G1224GP register is not modified.

The PI7C9X2G1224GP considers the 1st Data byte of the 4-byte Data phase, following the four Command bytes in the Command phase, as register Byte 3 (bits [31:24]). The next three Data bytes access register Bytes 2 through 0, respectively. Four Data bytes are required, regardless of the Byte Enable Settings in the Command phase. The Master can then generate either a STOP condition (to finish the transfer) or a repeated START condition (to start a new transfer). If the I²C Master sends more than the four Data bytes (violating PI7C9X2G1224GP protocol), further details regarding I²C protocol, the PI7C9X2G1224GP returns a NAK for the extra Data byte(s).

Table 7-12 describes each I²C Command byte for Write access. In the packet described in Figure 7-8, Command Bytes 0 through 3 for Writes follow the format specified in Table 7-12.

Table 7-11 I²C Register Write Access

The following tables illustrate a sample I²C packet for writing the PI7C9X2G1224GP SSID/SSVID register (offset F8h) for Port 0, with data 1234_5678h.

Note: The PI7C9X2G1224GP has a default I²C Slave address [6:0] value of 38h, with the I²C_ADDR[2:0] input having a value of 000. The byte sequence on the I²C Bus, as listed in the following tables, occurs after the START and before the STOP bits, by which the I²C Master frames the transfer.

7.3.2 I²C REGISTER READ ACCESS

When the I²C Master attempts to read a PI7C9X2G1224GP register, two packets are transmitted. The 1st packet consists of Address and Command Phase bytes to the Slave. The 2nd packet consists of Address and Data Phase bytes.

According to the I²C Bus, v2.1, a Read cycle is triggered when the Read/Write bit (bit 0) of the 1st cycle is Set. The Command phase reads the requested register content into the internal buffer. When the I²C Read access occurs, the internal buffer value is transferred on to the I²C Bus, starting from Byte 3 (bits [31: 24]), followed by the subsequent bytes, with Byte 0 (bits [7:0]) being transferred last. If the I²C Master requests more than four bytes, the PI7C9X2G1224GP re-transmits the same byte sequence, starting from Byte 3 of the internal buffer.

The 1st and 2nd I²C Read packets perform the following functions:

- 1st packet - Selects the register to read
- 2nd packet - Reads the register (sample 2nd packet provided is for a 7-bit PI7C9X2G1224GP I²C Slave address)

Although two packets are shown for the I²C Read, the I²C Master can merge the two packets together into a single packet, by not generating the STOP at the end of the first packet (Master does not relinquish the bus) and generating REPEAT START.

Table 7-13 describes each I²C Command byte for Read access. In the packet described in Figure 7-11, Command Bytes 0 through 3 for Reads follow the format specified in Table 7-13.

8 REGISTER DESCRIPTION

8.1 REGISTER TYPES

This chapter details the Packet Switch registers, including

- Bit names
- Description of register functions
- Type, refer to Table 8-1
- Whether the default value can be modified by EEPROM and/or I2C
- Default value

Table 8-1 Register Types

REGISTER TYPE	DEFINITION
HwInt	Hardware Initialization
RO	Read Only
RW	Read / Write
RWIC	Read / Write 1 to Clear
RsvdP	RO and must return 0 when read.

8.2 TRANSPARENT MODE CONFIGURATION REGISTERS

When the port of the Switch is set to operate at the transparent mode, it is represented by a logical PCI-to-PCI Bridge that implements type 1 configuration space header. The following table details the allocation of the register fields of the PCI 2.3 compatible type 1 configuration space header.

Other than the PCI 2.3 compatible configuration space header, the Switch also implements PCI express extended configuration space header, which includes advanced error reporting, virtual channel, and power budgeting capability registers. The following table details the allocation of the register fields of PCI express extended capability space header. The first extended capability always begins at offset 100h with a PCI Express Enhanced Capability header and the rest of capabilities are located at an offset greater than 0FFh relative to the beginning of PCI compatible configuration space.

19	Interrupt Status	RO	Indicates that an INTx Interrupt Message is pending internally to the device. In the Switch, the forwarding of INTx messages from the downstream device of the Switch port is not reflected in this bit. Must be hardwired to 0.	No	0
20	Capabilities List	RO	Set to 1b to enable support for the capability list (offset 34h is the pointer to the data structure).	No	1
21	66MHz Capable	RO	Does not apply to PCI Express. Must be hardwired to 0.	No	0
22	Reserved	RsvdP	Not Support.	No	0
23	Fast Back-to-Back Capable	RsvdP	Not Support.	No	0
24	Master Data Parity Error	RW1C	Set to 1b (by a requester) whenever a Parity error is detected or forwarded on the primary side of the port in a Switch. If the Parity Error Response Enable bit is cleared, this bit is never set.	No/Yes	0
26:25	DEVSEL# timing	RsvdP	Not Support.	No	00b
27	Signaled Target Abort	RsvdP	Not Support.	No	0
28	Received Target Abort	RsvdP	Not Support.	No	0
29	Received Master Abort	RsvdP	Not Support.	No	0
30	Signaled System Error	RW1C	Set to 1b when the Switch sends an ERR_FATAL or ERR_NONFATAL Message, and the SERR Enable bit in the Command register is 1.	No/Yes	0
31	Detected Parity Error	RW1C	Set to 1b whenever the primary side of the port in a Switch receives a Poisoned TLP.	No/Yes	0

8.2.5 REVISION ID REGISTER – OFFSET 08h

BIT	FUNCTION	TYPE	DESCRIPTION	EEPROM/ I2C-SMBUS	DEFAULT
7:0	Revision	RO	Indicates revision number of device.	Yes	00h

8.2.6 CLASS REGISTER – OFFSET 08h

BIT	FUNCTION	TYPE	DESCRIPTION	EEPROM/ I2C-SMBUS	DEFAULT
15:8	Programming Interface	RO	Read as 00h to indicate no programming interfaces have been defined for PCI-to-PCI Bridges.	No	00h
23:16	Sub-Class Code	RO	Read as 04h to indicate device is a PCI-to-PCI Bridge.	No	04h
31:24	Base Class Code	RO	Read as 06h to indicate device is a Bridge device.	No	06h

8.2.7 CACHE LINE REGISTER – OFFSET 0Ch

BIT	FUNCTION	TYPE	DESCRIPTION	EEPROM/ I2C-SMBUS	DEFAULT
7:0	Cache Line Size	RW	The cache line size register is set by the system firmware and the operating system cache line size. This field is implemented by PCI Express devices as a RW field for legacy compatibility, but it has no impact on any PCI Express device functionality.	No/Yes	00h

8.2.8 PRIMARY LATENCY TIMER REGISTER – OFFSET 0Ch

BIT	FUNCTION	TYPE	DESCRIPTION	EEPROM/ I2C-SMBUS	DEFAULT
15:8	Primary Latency Timer	RsvdP	Not Support.	No	00h

8.2.9 HEADER TYPE REGISTER – OFFSET 0Ch

BIT	FUNCTION	TYPE	DESCRIPTION	EEPROM/ I2C-SMBUS	DEFAULT
22:16	Header Type	RO	Read as 01h to indicate that the register layout conforms to the standard PCI-to-PCI Bridge layout.	No	01h
23	Multi-Function Device	RO	0b: Single function device 1b: Multiple functions device	No	1 for Up 0 for Down

8.2.10 BASE ADDRESS 0 REGISTER – OFFSET 10h (Upstream Port Only)

BIT	FUNCTION	TYPE	DESCRIPTION	EEPROM/ I2C-SMBUS	DEFAULT
0	Memory Space Indicator	RO	0b: indicate Memory Base address 1b: indicate I/O Base address	No	0
2:1	64-bit Addressing	RO	00b: 32-bit addressing 10b: 64-bit addressing Others: Reserved	No	00b
3	Prefetchable	RO	0b: Non-prefetchable 1b: Prefetchable	No	0
16:4	Reserved	RsvdP	Not Support.	No	0-0h
31:17	Base Address 0	RW	Use this Memory base address to map the packet switch registers.	No/Yes	0-0h

8.2.11 BASE ADDRESS 1 REGISTER – OFFSET 14h (Upstream Port Only)

BIT	FUNCTION	TYPE	DESCRIPTION	EEPROM/ I2C-SMBUS	DEFAULT
31:0	Base Address 1	RO/RW	RO when the Base Address 0 register is not 64-bit addressing (offset 10h[2:1] is not 10b). RW when the Base Address 0 register is 64-bit addressing. Base Address 1 is used to provide the upper 32 Address bits when offset 10h[2:1] is set to 10b.	No/Yes	0000_0000h

8.2.12 PRIMARY BUS NUMBER REGISTER – OFFSET 18h

BIT	FUNCTION	TYPE	DESCRIPTION	EEPROM/ I2C-SMBUS	DEFAULT
7:0	Primary Bus Number	RW	Indicates the number of the PCI bus to which the primary interface is connected. The value is set in software during configuration.	No/Yes	00h

8.2.13 SECONDARY BUS NUMBER REGISTER – OFFSET 18h

BIT	FUNCTION	TYPE	DESCRIPTION	EEPROM/ I2C-SMBUS	DEFAULT
15:8	Secondary Bus Number	RW	Indicates the number of the PCI bus to which the secondary interface is connected. The value is set in software during configuration.	No/Yes	00h

8.2.14 SUBORDINATE BUS NUMBER REGISTER – OFFSET 18h

BIT	FUNCTION	TYPE	DESCRIPTION	EEPROM/ I2C-SMBUS	DEFAULT
23:16	Subordinate Bus Number	RW	Indicates the number of the PCI bus with the highest number that is subordinate to the Bridge. The value is set in software during configuration.	No/Yes	00h

8.2.15 SECONDARY LATENCY TIMER REGISTER – OFFSET 18h

BIT	FUNCTION	TYPE	DESCRIPTION	EEPROM/ I2C-SMBUS	DEFAULT
31:24	Secondary Latency Timer	RsvdP	Not Support.	No	00h

8.2.16 I/O BASE ADDRESS REGISTER – OFFSET 1Ch

BIT	FUNCTION	TYPE	DESCRIPTION	EEPROM/ I2C-SMBUS	DEFAULT
3:0	32-bit Indicator	RO	Read as 1h to indicate 32-bit I/O addressing.	No	1h
7:4	I/O Base Address [15:12]	RW	Defines the bottom address of the I/O address range for the Bridge to determine when to forward I/O transactions from one interface to the other. The upper 4 bits correspond to address bits [15:12] and are writable. The lower 12 bits corresponding to address bits [11:0] are assumed to be 0. The upper 16 bits corresponding to address bits [31:16] are defined in the I/O base address upper 16 bits address register.	No/Yes	0h

8.2.17 I/O LIMIT ADDRESS REGISTER – OFFSET 1Ch

BIT	FUNCTION	TYPE	DESCRIPTION	EEPROM/ I2C-SMBUS	DEFAULT
11:8	32-bit Indicator	RO	Read as 1h to indicate 32-bit I/O addressing.	No	1h
15:12	I/O Limit Address [15:12]	RW	Defines the top address of the I/O address range for the Bridge to determine when to forward I/O transactions from one interface to the other. The upper 4 bits correspond to address bits [15:12] and are writable. The lower 12 bits corresponding to address bits [11:0] are assumed to be FFFh. The upper 16 bits corresponding to address bits [31:16] are defined in the I/O limit address upper 16 bits address register.	No/Yes	0h

8.2.18 SECONDARY STATUS REGISTER – OFFSET 1Ch

26:25	DEVSEL L timing	RsvdP	Not Support.	No	00b
27	Signaled Target Abort	RsvdP	Not Support.	No	0
28	Received Target Abort	RsvdP	Not Support.	No	0
29	Received Master Abort	RsvdP	Not Support.	No	0
30	Received System Error	RW1C	Set to 1b when the Switch sends an ERR_FATAL or ERR_NONFATAL Message, and the SERR Enable bit in the Bridge Control register is 1.	No/Yes	0
31	Detected Parity Error	RW1C	Set to 1b whenever the secondary side of the port in a Switch receives a Poisoned TLP.	No/Yes	0

8.2.19 MEMORY BASE ADDRESS REGISTER – OFFSET 20h

BIT	FUNCTION	TYPE	DESCRIPTION	EEPROM/ I2C-SMBUS	DEFAULT
3:0	Reserved	RsvdP	Not Support.	No	0h
15:4	Memory Base Address [31:20]	RW	Defines the bottom address of an address range for the Bridge to determine when to forward memory transactions from one interface to the other. The upper 12 bits correspond to address bits [31:20] and are able to be written to. The lower 20 bits corresponding to address bits [19:0] are assumed to be 0.	No/Yes	000h

8.2.20 MEMORY LIMIT ADDRESS REGISTER – OFFSET 20h

BIT	FUNCTION	TYPE	DESCRIPTION	EEPROM/ I2C-SMBUS	DEFAULT
19:16	Reserved	RsvdP	Not Support.	No	0h
31:20	Memory Limit Address [31:20]	RW	Defines the top address of an address range for the Bridge to determine when to forward memory transactions from one interface to the other. The upper 12 bits correspond to address bits [31:20] and are writable. The lower 20 bits corresponding to address bits [19:0] are assumed to be FFFFh.	No/Yes	000h

8.2.21 PREFETCHABLE MEMORY BASE ADDRESS REGISTER – OFFSET 24h

BIT	FUNCTION	TYPE	DESCRIPTION	EEPROM/ I2C-SMBUS	DEFAULT
3:0	64-bit addressing	RO	Read as 1h to indicate 64-bit addressing.	No	1h
15:4	Prefetchable Memory Base Address [31:20]	RW	Defines the bottom address of an address range for the Bridge to determine when to forward memory read and write transactions from one interface to the other. The upper 12 bits correspond to address bits [31:20] and are writable. The lower 20 bits are assumed to be 0. The memory base register upper 32 bits contain the upper half of the base address.	No/Yes	000h

8.2.22 PREFETCHABLE MEMORY LIMIT ADDRESS REGISTER – OFFSET 24h

BIT	FUNCTION	TYPE	DESCRIPTION	EEPROM/ I2C-SMBUS	DEFAULT
19:16	64-bit addressing	RO	Read as 1h to indicate 64-bit addressing.	No	1h
31:20	Memory Limit Address [31:20]	RW	Defines the top address of an address range for the Bridge to determine when to forward memory transactions from one interface to the other. The upper 12 bits correspond to address bits [31:20] and are writable. The lower 20 bits corresponding to address bits [19:0] are assumed to be FFFFh.	No/Yes	000h

8.2.23 PREFETCHABLE MEMORY BASE ADDRESS UPPER 32-BITS REGISTER – OFFSET 28h

BIT	FUNCTION	TYPE	DESCRIPTION	EEPROM/ I2C-SMBUS	DEFAULT
31:0	Prefetchable Memory Base Address, Upper 32-bits [63:32]	RW	Defines the upper 32-bits of a 64-bit bottom address of an address range for the Bridge to determine when to forward memory read and write transactions from one interface to the other.	No/Yes	0000_0000h

8.2.24 PREFETCHABLE MEMORY LIMIT ADDRESS UPPER 32-BITS REGISTER – OFFSET 2Ch

BIT	FUNCTION	TYPE	DESCRIPTION	EEPROM/ I2C-SMBUS	DEFAULT
31:0	Prefetchable Memory Limit Address, Upper 32-bits [63:32]	RW	Defines the upper 32-bits of a 64-bit top address of an address range for the Bridge to determine when to forward memory read and write transactions from one interface to the other.	No/Yes	0000_0000h

8.2.25 I/O BASE ADDRESS UPPER 16-BITS REGISTER – OFFSET 30h

BIT	FUNCTION	TYPE	DESCRIPTION	EEPROM/ I2C-SMBUS	DEFAULT
15:0	I/O Base Address, Upper 16-bits [31:16]	RW	Defines the upper 16-bits of a 32-bit bottom address of an address range for the Bridge to determine when to forward I/O transactions from one interface to the other.	No/Yes	0000h

8.2.26 I/O LIMIT ADDRESS UPPER 16-BITS REGISTER – OFFSET 30h

BIT	FUNCTION	TYPE	DESCRIPTION	EEPROM/ I2C-SMBUS	DEFAULT
31:16	I/O Limit Address, Upper 16-bits [31:16]	RW	Defines the upper 16-bits of a 32-bit top address of an address range for the Bridge to determine when to forward I/O transactions from one interface to the other.	No/Yes	0000h

8.2.27 CAPABILITY POINTER REGISTER – OFFSET 34h

BIT	FUNCTION	TYPE	DESCRIPTION	EEPROM/ I2C-SMBUS	DEFAULT
7:0	Capability Pointer	RO	Indicates next capability pointer.	Yes	40h

8.2.28 INTERRUPT LINE REGISTER – OFFSET 3Ch

BIT	FUNCTION	TYPE	DESCRIPTION	EEPROM/ I2C-SMBUS	DEFAULT
7:0	Interrupt Line	RW	Indicates the Interrupt Line.	No/Yes	00h

8.2.29 INTERRUPT PIN REGISTER – OFFSET 3Ch

BIT	FUNCTION	TYPE	DESCRIPTION	EEPROM/ I2C-SMBUS	DEFAULT
15:8	Interrupt Pin	RO	The Switch implements INTA virtual wire interrupt signals to represent hot-plug events at downstream ports. 0b: disable INTA 1b: enable INTA	Yes	00h for Up 01h for Down

8.2.30 BRIDGE CONTROL REGISTER – OFFSET 3Ch

BIT	FUNCTION	TYPE	DESCRIPTION	EEPROM/ I2C-SMBUS	DEFAULT
16	Parity Error Response	RW	0b: Ignore Poisoned TLPs on the secondary interface 1b: Enable the Poisoned TLPs reporting and detection on the secondary interface	No/Yes	0
17	S_SERR# Enable	RW	0b: Disables the forwarding of EER_COR, ERR_NONFATAL and ERR_FATAL from secondary to primary interface 1b: Enables the forwarding of EER_COR, ERR_NONFATAL and ERR_FATAL from secondary to primary interface	No/Yes	0
18	ISA Enable	RW	0b: Forwards downstream all I/O addresses in the address range defined by the I/O Base, I/O Base, and Limit registers 1b: Forwards upstream all I/O addresses in the address range defined by the I/O Base and Limit registers that are in the first 64KB of PCI I/O address space (top 768 bytes of each 1KB block)	No/Yes	0
19	VGA Enable	RW	0b: Ignores access to the VGA memory or IO address range 1b: Forwards transactions targeted at the VGA memory or IO address range VGA memory range starts from 000A 0000h to 000B FFFFh VGA IO addresses are in the first 64KB of IO address space. AD [9:0] is in the ranges 3B0 to 3BBh and 3C0h to 3DFh.	No/Yes	0
20	VGA 16-bit Decode	RW	0b: Executes 10-bit address decoding on VGA I/O accesses	No/Yes	0

BIT	FUNCTION	TYPE	DESCRIPTION	EEPROM/ I2C-SMBUS	DEFAULT
			1b: Executes 16-bit address decoding on VGA I/O accesses		
21	Master Abort Mode	RsvdP	Not Support.	No	0
22	Secondary Bus Reset	RW	0b: Does not trigger a hot reset on the corresponding PCI Express Port 1b: Triggers a hot reset on the corresponding PCI Express Port At the downstream port, it asserts PORT_RST# to the attached downstream device. At the upstream port, it asserts the PORT_RST# at all the downstream ports.	No/Yes	0

8.2.31 POWER MANAGEMENT CAPABILITIES REGISTER – OFFSET 40h

BIT	FUNCTION	TYPE	DESCRIPTION	EEPROM/ I2C-SMBUS	DEFAULT
7:0	Enhanced Capabilities ID	RO	Read as 01h to indicate that these are power management enhanced capability registers.	No	01h
15:8	Next Item Pointer	RO	Indicates next capability pointer.	Yes	48h
18:16	Power Management Revision	RO	Read as 011b to indicate the device is compliant to Revision 1.2 of <i>PCI Power Management Interface Specifications</i> .	No	011b
19	PME# Clock	RO	Does not apply to PCI Express. Must be hardwired to 0.	No	0
20	Reserved	RsvdP	Not Support.	No	0
21	Device specific Initialization	RO	Read as 0b to indicate Switch does not have device specific initialization requirements.	Yes	0
24:22	AUX Current	RO	Reset to 000b.	Yes	000b
25	D1 Power State Support	RO	Read as 0b to indicate Switch does not support the D1 power management state.	Yes	0
26	D2 Power State Support	RO	Read as 0b to indicate Switch does not support the D2 power management state.	Yes	0
31:27	PME# Support	RO	Read as 19h to indicate Switch supports the forwarding of PME# message in D0, D3 and D4 states.	Yes	19h

8.2.32 POWER MANAGEMENT DATA REGISTER – OFFSET 44h

BIT	FUNCTION	TYPE	DESCRIPTION	EEPROM/ I2C-SMBUS	DEFAULT
1:0	Power State	RW	Indicates the current power state of the Switch. Writing a value of D0 when the previous state was D3 cause a hot reset without asserting DWRST_L. 00b: D0 state 01b: D1 state 10b: D2 state 11b: D3 hot state	No/Yes	00b
2	Reserved	RsvdP	Not Support.	No	0
3	No_Soft_Reset	RO	When set, this bit indicates that device transitioning from D3hot to D0 does not perform an internal reset. When clear, an internal reset is performed when power state transits from D3hot to D0.	Yes	1

BIT	FUNCTION	TYPE	DESCRIPTION	EEPROM/ I2C-SMBUS	DEFAULT
7:4	Reserved	RsvdP	Not Support.	No	0h
8	PME# Enable	RW	When asserted, the Switch will generate the PME# message.	No/Yes	0
12:9	Data Select	RW / RO	Select data registers. RW if offset 870h[1]=1 and RO if offset 870h[1]=0.	No/Yes	0h
14:13	Data Scale	RO	Reset to 00b.	No	00b
15	PME Status	RW1C	Read as 0b as the PME# message is not implemented.	No	0

8.2.33 PPB SUPPORT EXTENSIONS REGISTER – OFFSET 44h

8.2.35 MSI CAPABILITIES REGISTER – OFFSET 48h

BIT	FUNCTION	TYPE	DESCRIPTION	EEPROM/ I2C-SMBUS	DEFAULT
7:0	Enhanced Capabilities ID	RO	Read as 05h to indicate that this is message signal interrupt capability register.	No	05h
15:8	Next Item Pointer	RO	Indicates next capability pointer.	Yes	68h
16	MSI Enable	RW	0b: The function is prohibited from using MSI to request service 1b: The function is permitted to use MSI to request service and is prohibited from using its INTx # pin	No/Yes	0
19:17	Multiple Message Capable	RO	Read as 000b.	No	000b
22:20	Multiple Message Enable	RW	Reset to 000b.	No/Yes	000b
23	64-bit address capable	RO	0b: The function is not capable of generating a 64-bit message address 1b: The function is capable of generating a 64-bit message address	No	1b
31:24	Reserved	RO	Not Support.	No	00h

8.2.36 MESSAGE ADDRESS REGISTER – OFFSET 4Ch

BIT	FUNCTION	TYPE	DESCRIPTION	EEPROM/ I2C-SMBUS	DEFAULT
1:0	Reserved	RsvdP	Not Support.	No	00b
31:2	Message Address	RW	If the message enable bit is set, the contents of this register specify the DWORD aligned address for MSI memory write transaction.	No/Yes	0-0h

8.2.37 MESSAGE UPPER ADDRESS REGISTER – OFFSET 50h

BIT	FUNCTION	TYPE	DESCRIPTION	EEPROM/ I2C-SMBUS	DEFAULT
31:0	Message Upper Address	RW	This register is only effective if the device supports a 64-bit message address is set.	No/Yes	0000_0000h

8.2.38 MESSAGE DATA REGISTER – OFFSET 54h

BIT	FUNCTION	TYPE	DESCRIPTION	EEPROM/ I2C-SMBUS	DEFAULT
15:0	Message Data	RW	Message data.	No/Yes	0000h

8.2.39 PCI EXPRESS CAPABILITIES REGISTER – OFFSET 68h

BIT	FUNCTION	TYPE	DESCRIPTION	EEPROM/ I2C-SMBUS	DEFAULT
7:0	Enhanced Capabilities ID	RO	Read as 10h to indicate that these are PCI express enhanced capability registers.	No	10h
15:8	Next Item Pointer	RO	Indicates next capability pointer.	Yes	A4h
19:16	Capability Version	RO	Read as 2h to indicate the device is compliant to Revision .2.0 of <i>PCI Express Base Specifications</i> .	No	2h
23:20	Device/Port Type	RO	Indicates the type of PCI Express logical device. 0101b: upstream port 0110b: downstream port	No	5h for Up 6h for Down
24	Slot Implemented	RO	Valid for downstream ports only. When set, indicates that the PCIe Link associated with this Port is connected to a slot. This field is valid for downstream ports of the Switch.	Yes	0 for Up 1 for Down
29:25	Interrupt Message Number	RO	No MSI messages are generated in the transparent mode.	No	00_000b
31:30	Reserved	RsvdP	Not Support.	No	00b

8.2.40 DEVICE CAPABILITIES REGISTER – OFFSET 6Ch

BIT	FUNCTION	TYPE	DESCRIPTION	EEPROM/ I2C-SMBUS	DEFAULT
2:0	Max_Payload_Size Supported	RO	Indicates the maximum payload size that the device can support for TLPs. 000b: 128 payload size 001b: 256 payload size 010b: 512 payload size	Yes	001b
4:3	Phantom Functions Supported	RO	Indicates the support for use of unclaimed function numbers as Phantom functions. Read as 00b, since the Switch does not act as a requester.	No	00b
5	Extended Tag Field Supported	RO	Indicates the maximum supported size of Tag field as a Requester. Read as 0, since the Switch does not act as a requester.	No	0
8:6	Endpoint L0s Acceptable Latency	RO	Acceptable total latency that an Endpoint can withstand due to the transition from L0s state to the L0 state. For Switch, the ASPM software would not check this value.	No	000b
11:9	Endpoint L1 Acceptable Latency	RO	Acceptable total latency that an Endpoint can withstand due to the transition from L1 state to the L0 state. For Switch, the ASPM software would not check this value.	No	000b
14:12	Reserved	RsvdP	Not Support.	No	000b
15	Role_Based Error Reporting	RO	When set, indicates that the device implements the functionality originally defined in the Error Reporting ECN.	Yes	1

BIT	FUNCTION	TYPE	DESCRIPTION	EEPROM/ I2C-SMBUS	DEFAULT
17:16	Reserved	RsvdP	Not Support.	No	00b
25:18	Captured Slot Power Limit Value	RO	It applies to Upstream Port only. In combination with the Slot Power Limit Scale value, specifies the upper limit on power supplied by slot. This value is set by the Set_Slot_Power_Limit message or hardwired to 0.	No	00h
27:26	Captured Slot Power Limit Scale	RO	It applies to Upstream Port only. Specifies the scale used for the Slot Power Limit Value. This value is set by the Set_Slot_Power_Limit message or hardwired to 0.	No	00b
31:28	Reserved	RsvdP	Not Support.	No	0h

8.2.41 DEVICE CONTROL REGISTER – OFFSET 70h

BIT	FUNCTION	TYPE	DESCRIPTION	EEPROM/ I2C-SMBUS	DEFAULT
0	Correctable Error Reporting Enable	RW	0b: Disable Correctable Error Reporting 1b: Enable Correctable Error Reporting	No/Yes	0
1	Non-Fatal Error Reporting Enable	RW	0b: Disable Non-Fatal Error Reporting 1b: Enable Non-Fatal Error Reporting	No/Yes	0
2	Fatal Error Reporting Enable	RW	0b: Disable Fatal Error Reporting 1b: Enable Fatal Error Reporting	No/Yes	0
3	Unsupported Request Reporting Enable	RW	0b: Disable Unsupported Request Reporting 1b: Enable Unsupported Request Reporting	No/Yes	0
4	Enable Relaxed Ordering	RO	When set, it permits the device to set the Relaxed Ordering bit in the attribute field of transaction. Since the Switch cannot either act as a requester or alter the content of packet it forwards, this bit always returns '0' when read.	No	0
7:5	Max_Payload_Size	RW	This field sets maximum TLP payload size for the device. Permissible values that can be programmed are indicated by the Max_Payload_Size Supported in the Device Capabilities register. Any value exceeding the Max_Payload_Size Supported written to this register results into clamping to the Max_Payload_Size Supported value.	No/Yes	000b
8	Extended Tag Field Enable	RW	Does not apply to PCI Express Switch. Returns '0' when read.	No	0
9	Phantom Function Enable	RW	Does not apply to PCI Express Switch. Returns '0' when read.	No	0
10	Auxiliary (AUX) Power PM Enable	RO	When set, indicates that a device is enabled to draw AUX power independent of PME AUX power.	No	0
11	Enable No Snoop	RO	When set, it permits to set the No Snoop bit in the attribute field of transaction. Since the Switch cannot either act as a requester or alter the content of packet it forwards, this bit always returns '0' when read.	No	0
14:12	Max_Read_Request_Size	RO	This field sets the maximum Read Request size for the device as a Requester. Since the Switch does not generate read request by itself, these bits are hardwired to 0.	No	000b
15	Reserved	RsvdP	Not Support.	No	0

8.2.42 DEVICE STATUS REGISTER – OFFSET 70h

BIT	FUNCTION	TYPE	DESCRIPTION	EEPROM/ I2C-SMBUS	DEFAULT
16	Correctable Error Detected	RW1C	Asserted when correctable error is detected. Errors are logged in this register regardless of whether error reporting is enabled or not in the Device Control register.	No/Yes	0

BIT	FUNCTION	TYPE	DESCRIPTION	EEPROM/ I2C-SMBUS	DEFAULT
17	Non-Fatal Error Detected	RW1C	Asserted when non-fatal error is detected. Errors are logged in this register regardless of whether error reporting is enabled or not in the Device Control register.	No/Yes	0
18	Fatal Error Detected	RW1C	Asserted when fatal error is detected. Errors are logged in this register regardless of whether error reporting is enabled or not in the Device Control register.	No/Yes	0
19	Unsupported Request Detected	RW1C	Asserted when unsupported request is detected. Errors are logged in this register regardless of whether error reporting is enabled or not in the Device Control register.	No/Yes	0
20	AUX Power Detected	RO	Asserted when the AUX power is detected by the Switch	No	0
21	Transactions Pending	RO	Each port of Switch does not issue Non-posted Requests on its own behalf, so this bit is hardwired to 0.	No	0

BIT	FUNCTION	TYPE	DESCRIPTION	EEPROM/ I2C-SMBUS	DEFAULT
3:0	Maximum Link Speed	RO	Indicates the maximum speed of the Express link. 0001b: 2.5 Gb/s 0010b: 5.0 Gb/s Others: Reserved	No	2h
9:4	Maximum Link Width	HWInt RO	Indicates the maximum width of the given PCIe Link. 00_0001b: x1 link 00_0010b: x2 link 00_0100b: x4 link 00_1000b: x8 link Others: Reserved	No	08h, 04h, 02h or 01h
11:10	Active State Power Management (ASPM) Support	RO	Indicates the level of ASPM supported on the given PCIe Link. Each port of Switch supports L0s and L1 entry.	Yes	01b
14:12	L0s Exit Latency	RO	Indicates the L0s exit latency for the given PCIe Link. The length of time this port requires to complete transition from L0s to L0 is in the range of 256ns to less than 512ns.	Yes	011b
17:15	L1 Exit Latency	RO	Indicates the L1 exit latency for the given PCIe Link. The length of time this port requires to complete transition from L1 to L0 is less than 1us.	Yes	000b
18	Clock Power Management	RO	For upstream port, a value of 1b indicates that component tolerates the removal of any reference clock via CLKREQ#. For downstream ports, this bit must be hardwired to 0.	Yes	1 for Up 0 for Down
19	Surprise Down Capability Enable	RO	Valid for downstream ports only.	Yes	0
20	Data Link Layer Active Reporting Capable	RO	For downstream ports, this bit must be set to 1b if the component supports the optional capability of reporting the DL_Active state of the Data Link Control and Management State Machine. For a hot-plug capable downstream port, this bit must be set to 1b. For upstream port, this bit must be hardwired to 0.	No	0
21	Link BW Notify Cap.	RO	Valid for downstream ports only.	Yes	0 for Up 1 for Down
23:22	Reserved	RsvdP	Not Support.	No	0
31:24	Port Number	RO	Indicates the PCIe Port Number for the given PCIe Link.	Yes	00h for Up 01 h for Port 1 02h for Port 2 03h for Port 3

0	Attention Button Present	RO	When set, it indicates that an Attention Button is implemented on the chassis for this slot.	Yes	1
1	Power Controller Present	RO	When set, it indicates that a Power Controller is implemented for this slot.	Yes	1
2	MRL Sensor Present	RO	When set, this bit indicates that an MRL Sensor is implemented on the chassis for this slot.	Yes	1
3	Attention Indicator Present	RO	When set, it indicates that an Attention Indicator is implemented on the chassis for this slot	Yes	1
4	Power Indicator Present	RO	When set, it indicates that a Power Indicator is implemented on the chassis for this slot.	Yes	1
5	Hot-Plug Surprise	RO	When set, it indicates that a device present in this slot might be removed from the system without any prior notification.	Yes	0
6	Hot-Plug Capable	HWInt RO	When set, it indicates that this slot is capable of supporting Hot-Plug operation. Without external I/O expander connected, the default value will be clear to 0.	Yes	0
14:7	Slot Power Limit Value	RO	In combination with the Slot Power Limit Scale value, specifies the upper limit on power supplied by slot. Writes to this register also cause the Port to send the Set Slot Power Limit message.	Yes	19h
16:15	Slot Power Limit Scale	RO	Specifies the scale used for the Slot Power Limit Value. Writes to this register also cause the Port to send the Set Slot Power Limit message.	Yes	00b
17	EM_INTRELOCK Present	RO	When set, it indicates that an Electromechanical Interlock Present is implemented on the chassis for this slot.	Yes	0
18	No Command Completed Support	RO	When set, it indicates that this slot does not generate software notification when an issued command is completed by the Hot-Plug Controller.	Yes	0
31:19	Physical Slot Number	RO	It indicates the physical slot number attached to this Port.	Yes	01 h for Port 1 04h for Port 4 05h for Port 5 ...

8.2.80 VC ARBITRATION TABLE REGISTER – OFFSET 188h

The VC arbitration table is a read-write register array that contains a table for VC arbitration. Each table entry allocates four bits, of which three bits are used to represent VC ID and one bit is reserved. A total of 32 entries are used to construct the VC arbitration table. The layout for this register array is shown below.

8.2.81 PORT ARBITRATION TABLE REGISTER (0) and (1) – OFFSET 198h and 1A8h

The Port arbitration table is a read-write register array that contains a table for Port arbitration. Each table entry allocates two bits to represent Port Number. The table entry size is dependent on the number of enabled ports (refer to bit 10 and 11 of Port VC capability register 1). The arbitration table contains 32 entries if three or four ports are to be enabled. The following table shows the register array layout for the size of entry equal to two.

8.2.114 SWITCH OPERATION MODE REGISTER – OFFSET 850h (Upstream Port Only)

BIT	FUNCTION	TYPE	DESCRIPTION	EEPROM/ I2C-SMBUS	DEFAULT
0	Store-Forward	RW	When set, a store-forward mode is used. Otherwise, the chip is working under cut-through mode.	Yes	0
2:1	Cut-through Threshold	RW	Cut-through Threshold. When forwarding a packet from low-speed port to high-speed mode, the chip provides the capability to adjust the forwarding threshold. 00b: the threshold is set at the middle of forwarding packet 01b: the threshold is set ahead 1-cycle of middle point 10b: the threshold is set ahead 2-cycle of middle point. 11b: the threshold is set ahead 3-cycle of middle point.	Yes	01b
3	Port Arbitration Mode	RW	When set, the round-robin arbitration will stay in the arbitrated port even if the credit is not enough but request is pending. When clear, the round-robin arbitration will always go to the requesting port, which the outgoing credit is enough for the packet queued in the port.	Yes	0
4	Credit Update Mode	RW	When set, the frequency of releasing new credit to the link partner will be one credit per update. When clear, the frequency of releasing new credit to the link partner will be two credits per update.	Yes	0
5	Ordering on Different Egress Port Mode	RW	When set, there has ordering rule on packets for different egress port.	Yes	0
6	Ordering on Different Tag of Completion Mode	RW	When set, there has ordering rule between completion packet with different tag.	Yes	1
7	NonPost TLP Store-Forward	RW	When set, for Non-port TLP store-forward mode is used. Otherwise, Non-post TLP is working under cut-through mode. When write '1', this bit is changed to '0'. When write '0', this bit is changed to '1'.	Yes	1

Other than the PCI 2.3 compatible configuration space header, the Switch also implements PCI express extended configuration space header, which includes advanced error reporting, virtual channel, and power budgeting capability registers. The following table details the allocation of the register fields of PCI express extended capability space header. The first extended capability always begins at offset 100h with a PCI Express Enhanced Capability header and the rest of capabilities are located at an offset greater than 0FFh relative to the beginning of PCI compatible configuration space.

8.3.22 POWER MANAGEMENT DATA REGISTER – OFFSET 44h

BIT	FUNCTION	TYPE	DESCRIPTION	EEPROM/ I2C-SMBUS	DEFAULT
1:0	Power State	RW	Indicates the current power state of the Switch. Writing a value of D0 when the previous state was D3 cause a hot reset without asserting DWRN_RST_L. 00b: D0 state 01b: D1 state 10b: D2 state 11b: D3 hot state	No/Yes	00b
2	Reserved	RsvdP	Not Support.	No	0

BIT	FUNCTION	TYPE	DESCRIPTION	EEPROM/ I2C-SMBUS	DEFAULT
3	No_Soft_Reset	RO	When set, this bit indicates that device transitioning from D3hot to D0 does not perform an internal reset. When clear, an internal reset is performed when power state transits from D3hot to D0.	Yes	1
7:4	Reserved	RsvdP	Not Support.	No	0h
8	PME# Enable	RW	When asserted, the Switch will generate the PME# message.	No/Yes	0
12:9	Data Select	RW	Select data registers RW if offset 870h[1]=1 and RO if offset 870h[1]=0.	No/Yes	0h
14:13	Data Scale	RO	Reset to 00b.	No	00b

8.3.30 DEVICE CAPABILITIES REGISTER – OFFSET 6Ch

BIT	FUNCTION	TYPE	DESCRIPTION	EEPROM/ I2C-SMBUS	DEFAULT
2:0	Max_Payload_Size Supported	RO	Indicates the maximum payload size that the device can support for TLPs. 000b: 128 payload size 001b: 256 payload size 010b: 512 payload size	Yes	001b
4:3	Phantom Functions Supported	RO	Indicates the support for use of unclaimed function numbers as Phantom functions. Read as 00b, since the Switch does not act as a requester.	No	00b
5	Extended Tag Field Supported	RO	Indicates the maximum supported size of Tag field as a Requester. Read as 0, since the Switch does not act as a requester.	No	0
8:6	Endpoint L0s Acceptable Latency	RO	Acceptable total latency that an Endpoint can withstand due to the transition from L0s state to the L0 state. For Switch, the ASPM software would not check this value.	No	111b
11:9	Endpoint L1 Acceptable Latency	RO	Acceptable total latency that an Endpoint can withstand due to the transition from L1 state to the L0 state. For Switch, the ASPM software would not check this value.	No	111b
14:12	Reserved	RsvdP	Not Support.	No	000b
15	Role_Based Error Reporting	RO	When set, indicates that the device implements the functionality originally defined in the Error Reporting ECN.	Yes	1
17:16	Reserved	RsvdP	Not Support.	No	00b
25:18	Captured Slot Power Limit Value	RO	In combination with the Slot Power Limit Scale value, specifies the upper limit on power supplied by slot. This value is set by the Set_Slot_Power_Limit message.	No	00h
27:26	Captured Slot Power Limit Scale	RO	Specifies the scale used for the Slot Power Limit Value.	No	00b

8.3.67 VC ARBITRATION TABLE REGISTER – OFFSET 188h

The VC arbitration table is a read-write register array that contains a table for VC arbitration. Each table entry allocates four bits, of which three bits are used to represent VC ID and one bit is reserved. A total of 32 entries are used to construct the VC arbitration table. The layout for this register array is shown below.

8.3.68 PORT ARBITRATION TABLE REGISTER (0) and (1) – OFFSET 198h and 1A8h

The Port arbitration table is a read-write register array that contains a table for Port arbitration. Each table entry allocates two bits to represent Port Number. The table entry size is dependent on the number of enabled ports (refer to bit 10 and 11 of Port VC capability register 1). The arbitration table contains 32 entries if three or four ports are to be enabled. The following table shows the register array layout for the size of entry equal to two.

Other than the PCI 2.3 compatible configuration space header, the Switch also implements PCI express extended configuration space header, which includes advanced error reporting, virtual channel, and power budgeting capability registers. The following table details the allocation of the register fields of PCI express extended capability space header. The first extended capability always begins at offset 100h with a PCI Express Enhanced Capability header and the rest of capabilities are located at an offset greater than 0FFh relative to the beginning of PCI compatible configuration space.

8.6 DMA ENGINE INTERFACE REGISTERS

To enable DMA function, the packet switch defines a set of interface registers for software to control the DMA engine and monitor the status of DMA transfer. There are two DMA engines (DMA_UP and DMA_NT) facing different CPU domains respectively, so it exists an independent interface for software to access its own registers in each CPU domain. The interface registers contain one global control DMA register, descriptor ownership registers shared by channels and per-channel control/status registers etc.

The interface registers are mapped to a dedicated 256-byte register block in Memory mode. The register block can be accessed by the DMA Memory Base Address, which is obtained by DMA Base Address Register 0 (Func1, CFG offset 10h).

Table 8-14 DMA Base Address in Memory Mode when NT function is enabled

DMA Engine	DMA Memory Base Address
DMA_UP for channel 0/1	BAR0 in the Virtual IF + 0000h
DMA_NT for channel 0/1	BAR0 in the Link IF + 0000h

Table 8-15 DMA Base Address in Memory Mode when NT function is disabled

DMA Engine	DMA Memory Base Address
DMA_UP for channel 0/1	BAR0 + 0000h
DMA_UP for channel 2/3	BAR0 + 0100h

Following is a summary of addressing map for interface registers. Please note that the max. length for read/write register only supports 4 bytes.

8.6.2 DESCRIPTOR OWNERSHIP REGISTER 0/1/2/3 – OFFSET 04h/08h/0Ch/10h

BIT	FUNCTION	TYPE	DESCRIPTION	DEFAULT
31:0	Descriptor Ownership	RW	Indicate the ownership of descriptor. That means the owner can access the buffer pointed by the address field of descriptor. 1b: the DMA engine owns the descriptor 0b: the DMA driver owns the descriptor After the buffer prepared by DMA driver, it will write "1" to the corresponding descriptor ownership bit. After the descriptor is done, the DMA engine will clear the corresponding bit to "0".	0000_000h

8.6.3 CHANNEL 0/1 DESCRIPTOR RING BASE POINTER (LOW 32-bit) REGISTER – OFFSET 24h/3Ch

BIT	FUNCTION	TYPE	DESCRIPTION	DEFAULT
5:0	Reserved	RsvdP	Not Support.	00_0000b
31:6	Descriptor Ring Base Pointer (Low 32-bit)	RW	Lower 32-bit of Base Pointer referring to the 1 st entry of descriptor ring. It tells DMA engine where the descriptor is starting at. The base pointer is in 64-bit alignment.	000_0000h

8.6.4 CHANNEL 0/1 DESCRIPTOR RING BASE POINTER (HIGH 32-bit) REGISTER – OFFSET 28h/40h

BIT	FUNCTION	TYPE	DESCRIPTION	DEFAULT
5:0	Reserved	RsvdP	Not Support.	00_0000b
31:6	Descriptor Ring Base Pointer (High 32-bit)	RW	Upper 32-bit of Base Pointer referring to the 1st entry of descriptor ring if 64-bit addressing system is used. It tells DMA engine where the descriptor is starting at.	000_0000h

8.6.5 CHANNEL 0/1 DESCRIPTOR CURRENT POINTER REGISTER – OFFSET 2Ch/44h

BIT	FUNCTION	TYPE	DESCRIPTION	DEFAULT
11:0	Descriptor Current Pointer (Offset from Base Pointer)	RO	Indicating the current pointer (Offset from Base Pointer) referring to the descriptor that is under processing by DMA Engine. A maximum of 128 pointers are allowed.	000h
31:12	Reserved	RsvdP	Not Support.	0_0000h

8.6.6 CHANNEL 0/1 TRANSFER COUNT STATUS of DESCRIPTOR CURRENT POINTER REGISTER – OFFSET 30h/48h

BIT	FUNCTION	TYPE	DESCRIPTION	DEFAULT
23:0	Transfer Count Status	RO	Indicating how many byte counts have been not transferred for the current descriptor pointer.	0000_00h
31:24	Reserved	RsvdP	Not Support.	00h

8.6.7 CHANNEL 0/1 DESCRIPTOR RING SIZE AND PREFETCH UPPER LIMIT REGISTER – OFFSET 34h/4Ch

BIT	FUNCTION	TYPE	DESCRIPTION	DEFAULT
7:0	Descriptor Ring Size	RW	It represents the quantity of descriptors in the ring. The size of ring must be greater than or equal to Prefetch Upper Limit. The sum of two channels of descriptor ring size cannot be larger than 128.	02h
11:8	Prefetch Upper Limit	RW	It represents the maximum number of prefetch-able descriptors for this channel. Only the value with a multiple of 4 or 1 can be set into this register. Any value other than these will be rounded to the nearest of multiple of 4 or 1. When the programmed limit is reached, the descriptor prefetching is stopped, and restarted again after the value drops below the limit. For a value of 1, only one descriptor is prefetched (Note: When that one descriptor is active, a second descriptor is prefetched). For a value of 4N, four descriptors are prefetched (Note: When the 4 th descriptor is active, another four descriptors are prefetched). Due to different descriptor length stored in the same queue, the maximum allowable prefetch upper limit is various among different addressing system or DMA engines. For DMA_UP in 32-bit address, the prefetch upper limit is 13. For DMA_UP in 64-bit address, the prefetch upper limit is 8. For DMA_NT in 32-bit address, the prefetch upper limit is 13. For DMA_NT in 64-bit address, the prefetch upper limit is 8.	1h
15:12	Reserved	RsvdP	Not Support.	0h

BIT	FUNCTION	TYPE	DESCRIPTION	DEFAULT
31:16	Fetch Data Gap Time Control	RW	16bits – per 4ns.	0000h

8.6.8 CHANNEL 0/1 DMA CONTROL AND STATUS REGISTER – OFFSET 38h/50h

BIT	FUNCTION	TYPE	DESCRIPTION	DEFAULT
0	DMA Start	RW	Start DMA Engine. 1b: the DMA engine starts to fetch and process the descriptors except the DMA abort or pause status is on. 0b: the current pointer will be moved to the descriptor ring base pointer and stop the DMA engine. It can only set stop when abort or ownership is empty.	0
1	DMA Pause Control	RW	Pause DMA Engine. When set, the DMA engine is paused to the next active descriptor after completing the processing on current descriptor. It means that no more descriptors are processed and prefetched until the “Paused” condition is lifted. Remote end firstly shall stop or pause and run status (offset 0x00 bit 27 or bit 24) or pause done status (offset 0x00 bit 28 or bit 25) has been asserted if local pause set. If pause interrupt is enable and pause control is enable the interrupt is asserted until pause interrupt or control is disable	0
2	DMA Abort Control	RW	Abort DMA Engine. When set, the DMA engine drops the current active descriptor by flushing out all outstanding read commands and discarding all received completion data. The pointer does not move to the next active descriptor. No more descriptors are processed and prefetched until the “Aborted” condition is lifted. All receiving data will be discarded if DMA abort asserted. Removing abort condition can only use DMA start disable If abort interrupt is enable and abort control is enable the interrupt is asserted until abort interrupt or control is disable.	0
3	DMA Pause Interrupt Enable	RW	Enable Interrupt when DMA engine is paused.	0
4	DMA Ring Stop Mode	RW	Notify DMA Engine how to run through descriptor ring. 0b: it continues to run over the end of descriptor ring 1b: it stops at descriptor ring base pointer when the last descriptor of ring is done	0
5	Ownership Flash	RW	Clear ownership register.	0
6	DMA Abort Interrupt Enable	RW	Enable Interrupt when DMA engine is abort.	0
15:7	Reserved	RsvdP	Not Support.	000h
16	DMA Pause Done Status	RO	Indicates the DMA engine is in “Paused” condition. Removing pause done status can use DMA Pause control.	0
17	DMA Abort Done Status	RO	Indicates the DMA engine is in “Aborted” condition. Removing abort done status can only use stop.	0
18	Reserved	RsvdP	Not Support.	0
19	Completer Status Error	RW1C	Error condition: unsupported request, completer abort.	0
30:20	Reserved	RsvdP	Not Support.	000h
31	Interrupt Flag	RW1C	Indicates the interrupt asserted.	0

9 CLOCK SCHEME

The built-in Integrated Reference Clock Buffer of the PI7C9X2G1224GP supports eight reference clock outputs in 324, 424, 524 or 624 modes. The clock buffer feature can be enabled and disabled by EEPROM, I2C or SMBUS.

When set to 324, 424, 524 or 624 mode, the clock buffer is enabled by default. The clock buffer distributes a single 100MHz reference clock input to eight Reference Clock Output Pairs, REFCLKO_P[8:1] and REFCLKO_N[8:1]. The clock buffer requires 100MHz differential clock inputs through REFCLKI_P and REFCLKI_N Pins as show in Table 9-1.

Table 9-1 AC Switching and DC Electrical Characteristics for REFCLKI_P/N and REFCLKO_P/N[8:1]

Symbol	Parameters	Min.	Typ.	Max.	Unit	Note
F_{IN}	Reference Clock Frequency		100		MHz

V_{swing}	Voltage including overshoot	550		1800	mV	2, 4
T_{DC}	Duty Cycle	45		55	%	3

Note:

1. Test configuration is $R_s=33.2\Omega$, $R_p=49.9\Omega$, and 2pF.
2. Measurement taken from Single Ended waveform.
3. Measurement taken from Differential waveform.
4. If the reference clock input is HCSL type, it should use DC coupling; if not in HCSL protocol (ex: LVPECL, LVDS, etc), it should be AC coupling, and refer to application note to add application circuit to rebuild dc bias. If rebuild dc bias for the best 400mV, there is no limit on the V_{swing} . However, there have two exceptions can be accepted:
 - a. If input is LVPECL, use ac-coupling and no rebuild dc bias, the min V_{swing} is 550mV (single ended).
 - b. If input is LVDS with 100 ohm cross at the inputs and use dc-coupling, the min V_{swing} is 250mV (single ended).

When set to 1124 or 1224 mode, the clock buffer is in power down mode and disabled by default. The 100MHz Reference Clock Output Pairs are disabled, and The PI7C9X2G1224GP requires 100MHz differential clock inputs through REFCLKP and REFCLKN Pins as shown in Table 9-2.

V_{LOW}	Voltage Low including undershoot			800	mV	2
V_{swing}	Voltage including overshoot	300			mV	2
T_{DC}	Duty Cycle	45		55	%	3

Note:

1. Does not include ± 300 ppm. Only certain clock frequencies will produce valid PCI Express data.
2. Measurement taken from Single-end waveform.
3. Measurement taken from Differential waveform.
4. As PCIe PHY accept CML type reference clock source and will rebuild command mode voltage by itself, it needs add ac-coupling.

10 POWER MANAGEMENT

The PI7C9X2G1224GP supports D0, D1, D2, D3-hot, and D3-cold Power States. The PCI Express Physical Link Layer of the PI7C9X2G1224GP device supports the PCI Express Link Power Management with L0, L0s, L1, L2/L3 ready and L3 Power States.

PI7C9X2G1224GP also supports ASPM (Active State Power Management) to facilitate the link power saving.

11 POWER SEQUENCE

As long as PERST# is active, all PCI Express functions are held in reset. The main supplies ramp up to their specified levels (3.3V). Sometime during this stabilization time, the REFCLK starts and stabilizes. After there has been time (100 ms) for the power and clock to become stable, PERST# is deasserted high and the PCI Express functions can start up.

It is recommended to power up the I/O voltage (3.3V) first and then the core voltage (1.0V) or power up I/O voltage and core voltage simultaneously.

Figure 11-1 Initial Power-Up Sequence

Power-down sequence is the reverse of power-up sequence.

12 IEEE 1149.1 COMPATIBLE JTAG CONTROLLER

An IEEE 1149.1 compatible Test Access Port (TAP) controller and associated TAP pins are provided to support boundary scan in PI7C9X2G1224GP for board-level continuity test and diagnostics. The TAP pins assigned are TCK, TDI, TDO, TMS and TRST_L. All digital input, output, input/output pins are tested except TAP pins.

12.1 INSTRUCTION REGISTER

The IEEE 1149.1 Test Logic consists of a TAP controller, an instruction register, and a group of test data registers including Bypass and Boundary Scan registers. The TAP controller is a synchronous 16-state machine driven by the Test Clock (TCK) and the Test Mode Select (TMS) pins. An independent power on reset circuit is provided to ensure the machine is in TEST_LOGIC_RESET state at power-up.

PI7C9X2G1224GP implements a 5-bit Instruction register to control the operation of the JTAG logic. The defined instruction codes are shown in the following table. Those bit combinations that are not listed are equivalent to the BYPASS (11111) instruction.

Table 12-1 Instruction Register Codes

Instruction	Operation Code (binary)	Register Selected	Operation
EXTEST	00000	Boundary Scan	Drives / receives off-chip test data
SAMPLE	00001	Boundary Scan	Samples inputs / pre-loads outputs
HIGHZ	00101	Bypass	Tri-states output and I/O pins except TDO pin
CLAMP	00100	Bypass	Drives pins from boundary-scan register and selects Bypass register for shifts
IDCODE	01100	Device ID	Accesses the Device ID register, to read manufacturer ID, part number, and version number
BYPASS	11111	Bypass	Selected Bypass Register
INT_SCAN	00010	Internal Scan	Scan test
MEM_BIST	01010	Memory BIST	Memory BIST test

12.2 BYPASS REGISTER

The required bypass register (one-bit shift register) provides the shortest path between TDI and TDO when a bypass instruction is in effect. This allows rapid movement of test data to and from other components on the board. This path can be selected when no test operation is being performed on the PI7C9X2G1224GP.

12.3 DEVICE ID REGISTER

This register identifies Diodes as the manufacturer of the device and details the part number and revision number for the device.

Table 12-2 JTAG Device ID Register

Bit	Type	Value	Description
31-28	RO	0001	Version number
27-12	RO	0001011000010110	Last 4 digits (hex) of the die part number
11-1	RO	010001111111	Diodes identifier assigned by JEDEC
0	RO	1	Fixed bit equal to 1'b1

12.4 BOUNDARY SCAN REGISTER

The boundary scan register has a set of serial shift-register cells. A chain of boundary scan cells is formed by connected the internal signal of the PI7C9X2G1224GP package pins. The VDD, VSS, and JTAG pins are not in the boundary scan chain. The input to the shift register is TDI and the output from the shift register is TDO. There are 4 different types of boundary scan cells, based on the function of each signal pin.

The boundary scan register cells are dedicated logic and do not have any system function. Data may be loaded into the boundary scan register master cells from the device input pins and output pin-drivers in parallel by the mandatory SAMPLE and EXTEST instructions. Parallel loading takes place on the rising edge of TCK.

13 ELECTRICAL AND TIMING SPECIFICATIONS

13.1 ABSOLUTE MAXIMUM RATINGS

Table 13-1 Absolute Maximum Ratings

(Above which the useful life may be impaired. For user guidelines, not tested.)

Item	Absolute Max. Rating
Storage Temperature	-65°C to 150°C
Junction Temperature, T _j	125°C
Digital core and analog supply voltage to ground potential (VDDC and AVDD)	-0.3v to 1.2v
Digital I/O and analog high supply voltage to ground potential (VDDR and AVDDH)	-0.3v to 3.8v
Reference Clock supply voltage to ground potential (CVDDR)	-0.3v to 3.8v
DC input voltage for Digital I/O signals	-0.3v to 3.8v

Note:

Stresses greater than those listed under MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods of time may affect reliability.

Note:

¹: Use external clock buffer, Disable internal clock buffer

Test Conditions:

- Typical power measured under the conditions of 1.0V/ 3.3V power rail without device usage on all downstream ports.
- Maximum power measured under the conditions of 1.1V/ 3.6V with PCIe2 devices usage on all downstream ports
- Ambient Temperature at 25°C
- Power consumption in the table is a reference, be affected by various environment, bus traffic and power supply etc.

Note:

1. T_a: Ambient Temperature
2. T_j: Junction Temperature
3. Maximum allowable junction temperature = 125°C
4. Θ_{JA}: Thermal Resistance, Junction-to-Ambient
5. Θ_{JC}: Thermal Resistance, Junction-to-Case
6. Power measured under the conditions of 1.0V/ 3.3V with PCIe2 devices usage on all downstream ports in 1224 mode
7. Power measured under the conditions of 1.0V/ 3.3V with PCIe2 devices usage on all downstream ports in 324 mode
8. The shaded fields provide a recommendation that allows PI7C9X2G1224GP to support Industrial Temperature Range
9. Customized 8L PCB Information
 - PCB Type : Customized 2s6p PCB
 - PCB Layers : 8
 - PCB Dimension : 101.6x114.3 mm²
 - PCB Thickness : 1.6 mm
 - PCB Material : FR4
 - Cu Trace Thickness : 0.070 mm (2oz)
 - Cu Plane Thickness : 0.035 mm (1oz)
 - PCB Thermal Via : 49 (7x7)
 - Thermal Via Diameter : 0.33 mm
 - Thermal Via Pitch : 1.00 mm
 - Copper Coverage : Cu-1&8~60%, Cu-2~7~80%
10. Heat Sink Information
 - Model: S1519-10W (Alpha Novatech, Inc.)
 - Heat sink size – 19x19x10 mm³

15 PACKAGE INFORMATION

The package of PI7C9X2G1224GP is a 19mm x 19mm HSBGA (324 Ball) package. The following are the package information and mechanical dimension:

Notes:

1. No purposely added lead. Fully EU Directive 2002/95/EC (RoHS), 2011/65/EU (RoHS 2) & 2015/863/EU (RoHS 3) compliant.
2. See <https://www.diodes.com/quality/lead-free/> for more information about Diodes Incorporated's definitions of Halogen- and Antimony-free, "Green" and Lead-free.
3. Halogen- and Antimony-free "Green" products are defined as those which contain <900ppm bromine, <900ppm chlorine (<1500ppm total Br + Cl) and <1000ppm antimony compounds.
