Features

- Precision supply-voltage monitor
  - 4.63V (PT7M78xxL)
  - 4.38V (PT7M78xxM)
  - 3.08V (PT7M78xxT)
  - 2.93V (PT7M78xxS)
  - 2.63V (PT7M78xxR)
  - 2.32V (PT7M78xxZ)
  - 2.20V (PT7M78xxY)
  - 4.00V (PT7M78xxJ)
  - 2.25V (PT7M78xxK)
  - 2.80V (PT7M78xxG)
- 200ms reset pulse width
- Debounced CMOS-compatible manual-reset input (7811, 7812, 7823, 7825)
- Reset Output Signal for Watchdog and Power Abnormal, Manual Reset
- Reset Push-Pull output (PT7M7809,7811,7823, 7824,7825)
- Reset Open-Drain output (PT7M7803)
- Voltage monitor for power-fail or low battery warning
- Guaranteed $\overline{\text{RESET}}$/RESET valid at V_{CC}=1.0V

Description

The PT7M78xx family microprocessor (µP) supervisory circuits are targeted to improve reliability and accuracy of power-supply circuitry in µP systems. These devices reduce the complexity and number of components required to monitor power-supply and battery functions.

The main functions are:

1. Asserting reset output during power-up, power-down and brownout conditions for µP system.
2. Watchdog functions
3. Manual reset.

Applications

- Power-supply circuitry in µP systems
- Networking
- Security System
- Server/Storage
- Embedded System

Function Comparison Table

Pin Description

Pin	Type	Description
$\overline{MR}$	I	**Manual-Reset: (CMOS).** Active low. Pull low to force a reset. Reset remains asserted for the duration of the Reset Timeout Period after $\overline{MR}$ transitions from low to high. Leave unconnected or connected to VCC if not used.
VCC	Power	**Supply Voltage.** Reset is asserted when V_{CC} drops below the Reset Threshold Voltage (V_{RST}). Reset remains asserted until V_{CC} rises above V_{RST} and keep asserted for the duration of the Reset Timeout Period (t_{RS}) once V_{CC} rises above V_{RST}.
GND	-	**Ground Reference** for all signals.
WDI	I	**Watchdog Input (CMOS).** If WDI remains high or low for the duration of the watchdog timeout period (t_{WD}), the internal watchdog timer trigger a reset output. Floating WDI or connecting WDI to a high-impedance three-state buffer disables the watchdog feature. The internal watchdog timer clears whenever reset is asserted or WDI occurs a rising or falling edge.
$\overline{RESET}$	O	**Active-Low Reset Output (Push-Pull or Open-Drain).** It goes low when Vcc is below the reset threshold. It remains low for about 200ms after one of the following occurs: Vcc rises above the reset threshold (VRST), the watchdog triggers a reset, or MR goes from low to high.
RESET	O	**The inverse of $\overline{RESET}$,** active high. Whenever $\overline{RESET}$ is high, RESET is low.
NC	-	**No connection.**

Maximum Ratings

Storage Temperature .....-65°C to +150°C
Ambient Temperature with Power Applied..... -40°C to +85°C
Supply Voltage to Ground Potential (Vcc to GND) .....-0.3V to +7.0V
DC Input Voltage (All inputs except Vcc and GND).....-0.3V to V_{CC}+0.3V
Open-drain RESET .....-0.3V to +7.0V
DC Output Current (All outputs) 20mA
Power Dissipation ..... 320mW (Depend on package)

Note:
Stresses greater than those listed under MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

Recommended Operation Conditions

Sym	Description	Test Conditions	Min.	Typ.	Max.	Unit
V_{CC}	Supply Voltage for 78xxL/M/J	-	4.5	5.0	5.5	V
	Supply Voltage for 78xxT/S	-	3.0	3.3	5.5	V
	Supply Voltage for 78xxR/Z/Y/K/G	-	2.7	3.0	5.5	V
V_{IH}	Input High Voltage (WDI, $\overline{MR}$)	-	$0.7V_{CC}$	-	V_{CC}	V
	Input High Voltage for Open-drain RESET		0	--	5.5	V
V_{IL}	Input Low Voltage	-	-	-	$0.3V_{CC}$	V
T_A	Operating Temperature	-	-40	-	85	℃

DC Electrical Characteristics

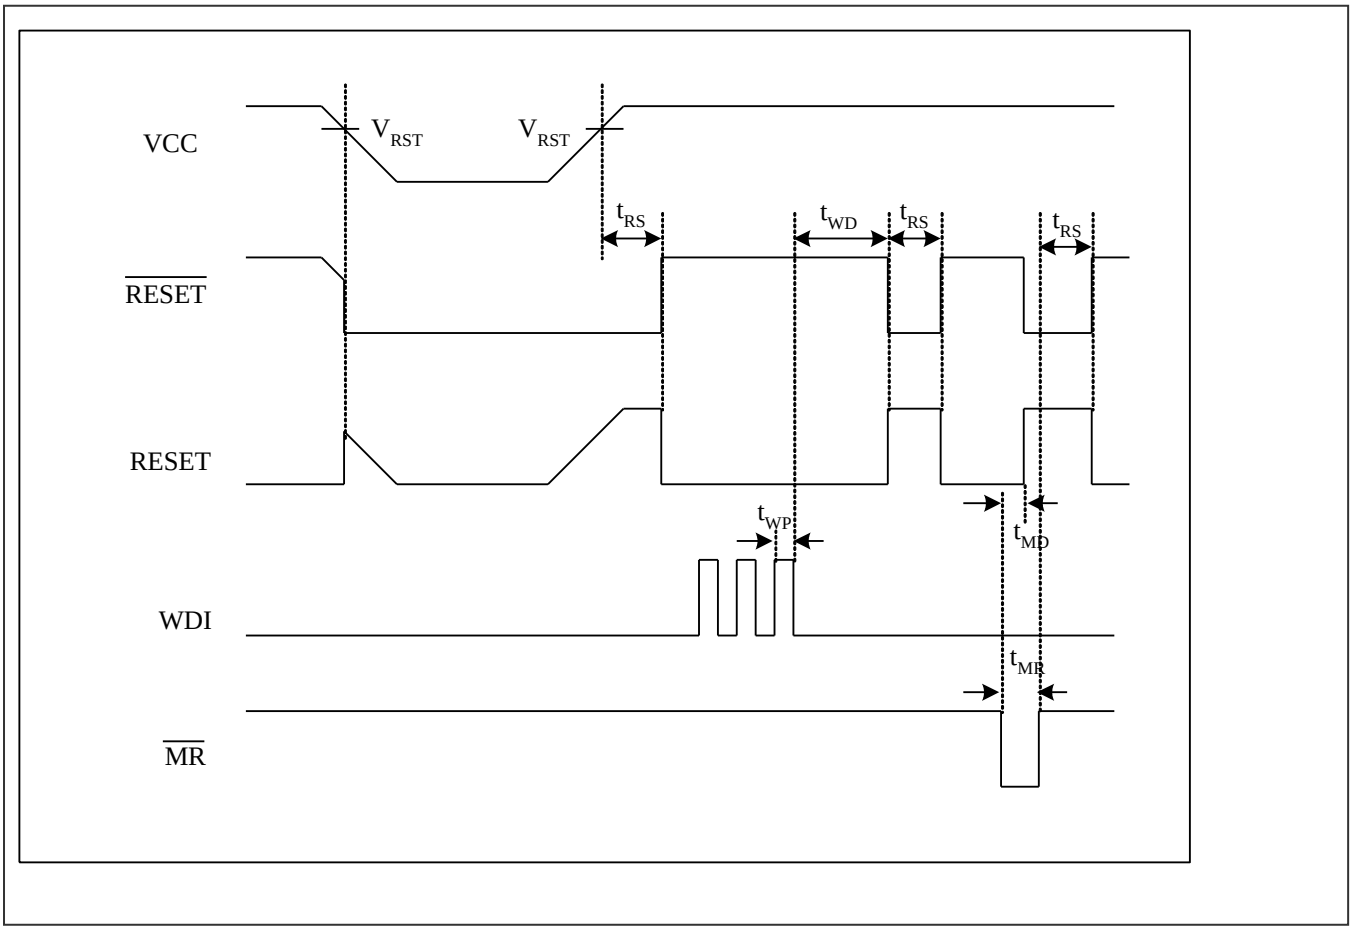
		Vcc ≥ 2.7V Isource=500μA		0.8×Vcc	-	-	
		Vcc ≥ 1.8V Isource=150μA		0.8×Vcc	-	-	
		Vcc ≥ 1.0V Isource=4μA		0.8×Vcc	-	-	
	Output High Voltage(7823/24/25)	7823/24/25L/M, Vcc=V_{RST} Isource=120μA		Vcc-1.5	-	-	V
		7823/24/25T/S/R/K, Vcc=V_{RST} Isource=30μA		0.8×Vcc	-	-	V
V_{OL}	Output Low Voltage	Vcc ≥ 4.5V Isink=3.2mA		-	-	0.4	V
		Vcc ≥ 2.7V Isink=1.2mA		-	-	0.3	
		Vcc ≥ 1.0V Isink=100μA		-	-	0.3	
I_{LKG}	Open-Drain Output Leakage Current	V_{CC} > $V_{TH(MAX)}$ for 7803		-	-	1	μA
I_{WDI}	Average WDI Input Current (**Note 3**)	WDI connected to V_{CC}: 5.5V		-	120	160	μA
		WDI connected to GND		-20	-15	-	
I_{source}	$\overline{RESET}$ Output Short-Circuit Current (only for PT7M7823/24/25)	PT7M782xL/M, $\overline{RESET}$=0V, Vcc=5.5V		-	-	800	μA
		PT7M782xT/S/R/K/Z/Y, $\overline{RESET}$=0V, Vcc=3.6V		-	-	400	
r	MR pull-up resistor (internal)	PT7M7811/7812		10	20	40	kΩ
		PT7M7823/7824/7825		35	52	75	

Note: 1. Parameters of room temperature guaranteed by production test and parameters of full-temperature guaranteed by design.
2. Valid for both $\overline{RESET}$ and RESET. V_{RST} (V_{RTH}-) is the Reset threshold voltage when V_{CC} from high to low level, and V_{RTH}+ is the Reset threshold voltage when V_{CC} from low to high level. V_{RN} is nominal reset threshold voltage.
3. WDI is internally serviced within the watchdog period if WDI is left unconnected.

AC Electrical Characteristics

Symbol	Description	Test Conditions	Min.	Typ.	Max.	Unit
t_{RS}	Reset Pulse Width	$\overline{MR}$ from low to High.	140	200	400	ms
t_{WD}	Watchdog Timeout Period	WDI, $\overline{MR}$ tied to Vcc, Vcc>V_{RN}+5%.	1.12	1.6	2.25	s
t_{MR}	$\overline{MR}$ Pulse Width	-	200	-	-	ns
t_{MD}	$\overline{MR}$ to $\overline{RESET}$ Delay	Vcc=5V	-	-	250	ns
t_{WP}	WDI Pulse Width	-	150	-	-	ns

Watchdog Timing Diagram



Functional Description

Reset Output

A microprocessor (µP) reset input starts the µP in a known state. Whenever the µP is in an unknown state, it should be held in reset. The supervisory circuits assert reset during power-up and prevent code execution errors during power-down or brownout conditions.

On power-up, once Vcc reaches about 1.0V, $\overline{\text{RESET}}$ is a guaranteed logic low of 0.4V or less. As Vcc rises, $\overline{\text{RESET}}$ stays low. When Vcc rises above the reset threshold, an internal timer releases $\overline{\text{RESET}}$ after about 200ms. $\overline{\text{RESET}}$ pulses low whenever Vcc drops below the reset threshold, i.e. brownout condition. If brownout occurs in the middle of a previously initiated reset pulse, the pulse continues for at least another 200ms. On power-down, once Vcc falls below the reset threshold, $\overline{\text{RESET}}$ stays low and is guaranteed to be 0.4V or less until Vcc drops below 1.0V. Watchdog Timing Diagram shows the timing relationship.

The active-high RESET output is simply the inverse of the $\overline{\text{RESET}}$ output, and is guaranteed to be valid with Vcc down to 1.0V.

Watchdog Timer

The PT7M78xx watchdog circuit monitors the µP activity. If the µP does not toggle the watch-dog input (WDI) within 1.6s, reset asserts. As long as reset is asserted or the WDI input is toggled, the watchdog timer will stay clear and will not count. As soon as reset is released, the timer will start counting. WDI input pulses as short as 150ns can be detected.
Disable the watchdog function by leaving WDI unconnected or by three-stating driver connected to WDI.
Do not apply voltage level on DCI over Vcc.

Manual Reset

The manual-reset input ($\overline{\text{MR}}$) allows reset to be triggered by a push button switch. $\overline{\text{MR}}$ has an internal pullup resistor, so it can be left open when not used. Do not apply voltage level over Vcc.

LIFE SUPPORT

Diodes Incorporated products are specifically not authorized for use as critical components in life support devices or systems without the express written approval of the Chief Executive Officer of Diodes Incorporated. As used herein:

A. Life support devices or systems are devices or systems which:

1. are intended to implant into the body, or

2. support or sustain life and whose failure to perform when properly used in accordance with instructions for use provided in the labeling can be reasonably expected to result in significant injury to the user.

B. A critical component is any component in a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or to affect its safety or effectiveness.

Customers represent that they have all necessary expertise in the safety and regulatory ramifications of their life support devices or systems, and acknowledge and agree that they are solely responsible for all legal, regulatory and safety-related requirements concerning their products and any use of Diodes Incorporated products in such safety-critical, life support devices or systems, notwithstanding any devices- or systems-related information or support that may be provided by Diodes Incorporated. Further, Customers must fully indemnify Diodes Incorporated and its representatives against any damages arising out of the use of Diodes Incorporated products in such safety-critical, life support devices or systems.
