

AL8808EV2 EVALUATION BOARD USER GUIDE

DESCRIPTION

The AL8808EV2 is an evaluation board showing the application of the Diodes Incorporated AL8808 LED driver device on a board suitable for use in an MR16 LED lamp. The board has four main connections: two power inputs P1 and P2, and two LED connections Anode (A) and Cathode (K). The evaluation board is preset to drive 680mA into a single LED.

The operating voltage is nominally 12VAC or DC. The 33 μ H inductor used in the circuit is based on this nominal supply, which should be connected across the P1 and P2 pins.

Note: The input bridge rectifier provides the board with reverse battery protection.

The nominal current, 680mA, is set with the 0R15 sense resistor, R1.

The CTRL pin on the device is not used in this application.

Warning: The LED will be hot and very bright

AL8808 DEVICE DESCRIPTION

The AL8808 is a continuous mode inductive driver in a TSOT25 package, for driving one or more series-connected LEDs efficiently from a voltage source higher than the LED voltage. The device includes the output switch and a current sense circuit, which requires an external sense resistor to set the nominal current up to 1000mA.

AL8808 DEVICE FEATURES

- Drives one or more series-connected LEDs
- LEDs up to 1000mA.
- Internal 30V switch.
- Wide input voltage: 6V to 30V.
- Inherent open circuit LED protection.
- Built in over temperature protection.
- Brightness control using DC or PWM.

DEVICE APPLICATIONS

- LED flashlights.
- High Power LED driving.
- Low-voltage halogen replacement LEDs.
- Automotive lighting.
- Illuminated signs.

AL8808 Device Package, Pin and Definitions

TSOT25 package

Pin Definition

Name	Pin No	Description
SW	1	Drain of NDMOS switch.
GND	2	Ground (0V).
CTRL	3	Internal voltage ref. pin (5V) : <ul style="list-style-type: none"> • Leave floating for normal operation. • Connect to GND to turn off output current. • Drive with DC voltage (0.4V to 2.5V) or with PWM signal to adjust output current
SET	4	Connect a sense resistor, R_s , from the SET pin to V_{IN} to sense the nominal output current. Nominal $I_{out} = 0.1 / R_1$
VIN	5	Input voltage: 6V to 30V. Decouple to ground with a 4.7uF or higher ceramic capacitor.

AL8808EV2 EVALUATION BOARD REFERENCE DESIGN

The AL8808EV2 is configured to the reference design shown in Figure 3. For other reference designs or further applications information, please refer to the AL8808 datasheet.

The operating voltage is a nominal 12V AC or DC. The nominal current is set at 680mA with a 0R15 sense resistor R1. The circuit operates in continuous mode at approximately 300kHz, (with DC voltage), with a 33uH inductor and one LED.

- P1 and P2 are the power input pads, feeding into the bridge rectifier, comprising of D2, D3, D4 and D5. C5 offers EMI filtering at the input pads.
- C1 and C2 form the bulk reservoir capacitance, used to sustain operation of the device during the low part of the AC wave. In the case of a system driving a single LED, only C2 is needed. C1 is not fitted.
- C3 provides local decoupling for the AL8808 device U1. It is important that this is as close as possible to U1, as shown in the layout. C4 decouples the LED connections to minimise EMI and to smooth the current.
- L1 smooth's the switching at LX into a DC current for the LED string. D1 operates as the freewheeling diode, preventing large voltage spikes at LX.
- L2 is not fitted, and the pads are shorted with a link on this evaluation board. Its purpose is to reduce EMI. Both L2 and C6 form a filter circuit to reduce conducted EMI if necessary. In many cases they may not be required, and where that is so, then L2 pads are shorted out and C6 is not fitted.
- R1 sets the LED current. The 0R15 resistor shown gives a LED current of 680mA.
- Optional extra parts are marked by an asterisk and are NOT fitted on the PCB.

AL8808 Operation

In normal operation, when voltage is applied at +Vin, the AL8808 internal NDMOS switch is turned on. Current starts to flow through sense resistor R1, inductor L1, and the LED. The current ramps up linearly, and the ramp rate is determined by the input voltage +Vin and the inductor L1. This rising current produces a voltage ramp across R1. The internal circuit of the AL8808 senses the voltage across R1 and applies a proportional voltage to the input of the internal comparator. When this voltage reaches an internally set upper threshold, the NDMOS switch is turned off. The inductor current continues to flow through R1, L1, the LED and the schottky diode D1, and back to the supply rail, but it decays, with the rate of decay determined by the forward voltage drop of the LEDs and the schottky diode. This decaying current produces a falling voltage at R1, which is sensed by the AL8808. A voltage proportional to the sense voltage across R1 is applied at the input of the internal comparator. When this voltage falls to the internally set lower threshold, the NDMOS switch is turned on again. This switch-on-and-off cycle continues to provide the average LED current set by the sense resistor R1. Please refer to the datasheets for the threshold limits, AL8808 internal circuits, electrical characteristics and parameters.

AL8808EV2 Component List

PCB IDENTITY	VALUE	DESCRIPTION	SUGGESTED SOURCE
U1	AL8808	LED Driver IC	Diodes Inc.
D1, D2, D3, D4, D5	DFLS240L	Input bridge & freewheeling diode	Diodes Inc.
R1	0R15	Resistor, 0805, +/-1% <+/- 300ppm Generic KOA SR732ATTDR150F	Kemet
C2	150uF 20v	SMD tantalum Kemet D case, T491X157K020AT	Kemet
C1	---	Not Fitted	---
C3	100nF >=25v	X7R 0805 Generic Kemet C0805C104K5RAC (50v) NIC NMC0805X7R104K50TRPF (50v)	Kemet NIC Components
C4	1uF >=25v	X7R 1206 Generic Kemet C1206105K5RAC7800 (50v) NIC NMC1206X7R105K50F (50v)	Kemet NIC Components
C5	100nF >=25v	X7R 0603 Generic	Farnell
C6	---	Not Fitted	---
L1	33uH	LPS6235 - 333MLB	Coilcraft
L2	0R0	Shorting link fitted	---

NOTE: The component part numbers are correct at the time of publication. Diodes Inc reserves the right to substitute other parts where necessary, without further notification.

AL8808EV2 Basic operation at full voltage

1. Connect P1 and P2 to the power supply
2. Set the PSU to 12VAC or 12VDC
3. Turn on the PSU. The LED will illuminate and the current should be approximately 680mA.
Warning: Do not stare at the LED directly.

Changing the LED current

1. Remove R1.
2. Calculate and fit a new sense resistor, R1, the value of which is based on the required LED current without dimming. R1 can be calculated using following equation :

$$R1 = 0.1V/I_{OUT}$$

where I_{OUT} = the LED current.

R1 = the sense resistor value in ohms.

0.1V is the nominal sense voltage with 'CTRL' open circuit or set to 5V.

An on-line Calculator is available to speed up the design process at:

PERFORMANCE

System Efficiency

The system efficiency depends on the sense resistor, supply voltage, switching inductor and the number of LEDs.

With a 12VDC supply, $L1=33\mu\text{H}$ and two series LEDs with LED current = 680mA, the switching frequency is typically 310kHz, and the efficiency level is ~ 86%.

Using the same components, but with three series LEDs, the switching frequency is typically 180kHz and the efficiency rises to ~ 89%.

LIFE SUPPORT

Diodes Incorporated products are specifically not authorized for use as critical components in life support devices or systems without the express written approval of the Chief Executive Officer of Diodes Incorporated. As used herein:

A. Life support devices or systems are devices or systems which:

1. are intended to implant into the body, or
2. support or sustain life and whose failure to perform when properly used in accordance with instructions for use provided in the labeling can be reasonably expected to result in significant injury to the user.

B. A critical component is any component in a life support device or system whose failure to perform can be reasonably be expected to cause the failure of the life support device or to affect its safety or effectiveness.

Customers represent that they have all necessary expertise in the safety and regulatory ramifications of their life support devices or systems, and acknowledge and agree that they are solely responsible for all legal, regulatory and safety-related requirements concerning their products and any use of Diodes Incorporated products in such safety-critical, life support devices or systems, notwithstanding any devices- or systems-related information or support that may be provided by Diodes Incorporated. Further, Customers must fully indemnify Diodes Incorporated and its representatives against any damages arising out of the use of Diodes Incorporated products in such safety-critical, life support devices or systems.
