## 2.5 Memory Organization

The XC835/836 CPU operates in the following five address spaces:

- 8 Kbytes of Boot ROM, Library ROM and User routines
- 256 bytes of internal RAM
- 256 bytes of XRAM  
(XRAM can be read/written as program memory or external data memory)
- A 128-byte Special Function Register area
- 4/8 Kbytes of Flash

**Figure 6** illustrates the memory address spaces of the 4 Kbyte Flash devices. **Figure 7** illustrates the memory address spaces of the 8 Kbyte Flash devices.

**Figure 6** Memory Map of XC835/836 with 4 Kbytes of Flash memory

## 2.6 JTAG ID

JTAG ID register is a read-only register located inside the JTAG module, and is used to recognize the device(s) connected to the JTAG interface. Its content is shifted out when INSTRUCTION register contains the IDCODE command (opcode 04<sub>H</sub>), and the same is also true immediately after reset.

The JTAG ID register contents for the XC835/836 Flash devices are given in [Table 4](#).

**Table 4 JTAG ID Summary**

Device Type	Device Name	JTAG ID
Flash	XC835*-2FG	101B A083 <sub>H</sub>
	XC836*-2FR	
	XC836*-1FR	101B B083 <sub>H</sub>

*Note: The asterisk (\*) above denotes all possible device configurations.*

## 2.7 Chip Identification Number

The XC835/836 identity (ID) register is located at Page 1 of address B3<sub>H</sub>. The value of ID register is 59<sub>H</sub>. However, for easy identification of product variants, the Chip Identification Number, which is a unique number assigned to each product variant, is available. The differentiation is based on the product and variant type information.

Two methods are provided to read a device's Chip Identification number:

- In-application subroutine, GET\_CHIP\_INFO
- Boot-loader (BSL) mode A

**Table 5** lists the Chip Identification numbers of XC835/836 device variants.

**Table 5 Chip Identification Number**

Product Variant	Chip Identification Number

## 3 Electrical Parameters

**Chapter 3** provides the characteristics of the electrical parameters which are implementation-specific for the XC835/836.

### 3.1 General Parameters

The general parameters are described here to aid the users in interpreting the parameters mainly in **Section 3.2** and **Section 3.3**.

#### 3.1.1 Parameter Interpretation

The parameters listed in this section represent partly the characteristics of the XC835/836 and partly its requirements on the system. To aid interpreting the parameters easily when evaluating them for a design, they are indicated by the abbreviations in the "Symbol" column:

- **CC**
  - These parameters indicate **C**ontroller **C**haracteristics, which are distinctive features of the XC835/836 and must be regarded for a system design.
- **SR**
  - These parameters indicate **S**ystem **R**equirements, which must be provided by the microcontroller system in which the XC835/836 is designed in.

### 3.1.2 Absolute Maximum Rating

Maximum ratings are the extreme limits to which the XC835/836 can be subjected to without permanent damage.

**Table 6 Absolute Maximum Rating Parameters**

Parameter	Symbol	Limit Values		Unit	Notes
		Min.	Max.		
Ambient temperature	$T_A$	-40	125	°C	under bias
Storage temperature	$T_{ST}$	-65	150	°C	–
Junction temperature	$T_J$	-40	150	°C	under bias
Voltage on power supply pin with respect to $V_{SS}$	$V_{DDP}$	-0.5	6	V	
Maximum current per pin for P1[3:0]	$I_M$	-115	115	mA	
Input current on any pin during overload condition	$I_{IN}$	-10	10	mA	
Absolute sum of all input currents during overload condition	$\Sigma I_{IN} $	–	50	mA	

*Note: Stresses above those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability. During absolute maximum rating overload conditions ( $V_{IN} > V_{DDP}$  or  $V_{IN} < V_{SS}$ ) the voltage on  $V_{DDP}$  pin with respect to ground ( $V_{SS}$ ) must not exceed the values defined by the absolute maximum ratings.*

### 3.1.3 Operating Condition

The following operating conditions must not be exceeded in order to ensure correct operation of the XC835/836. All parameters mentioned in the following tables refer to these operating conditions, unless otherwise noted.

**Table 7 Operating Condition Parameters**

Parameter	Symbol	Limit Values		Unit	Notes/ Conditions
		Min.	Max.		
Digital power supply voltage	$V_{DDP}$	3.0	5.5	V	
		2.5	3.0	V	<sup>1)</sup>
Digital core supply voltage <sup>2)</sup>	$V_{DDC}$	2.3	2.7	V	
CPU Clock Frequency	$f_{CCLK}$	22.5	25.6	MHz	typ. 24 MHz
		7.5	8.5	MHz	typ. 8 MHz
Ambient temperature	$T_A$	-40	85	°C	SAF-XC835/836...
		-40	125	°C	SAK-XC836...

1) In this voltage range, limited operations are available in active mode. Operations in power save modes are fully supported.

2)  $V_{DDC}$  is supplied by the on-chip EVR. The limits are verified by design and production testing.

### 3.2 DC Parameters

The electrical characteristics of the DC Parameters are detailed in this section.

#### 3.2.1 Input/Output Characteristics

**Table 8** provides the characteristics of the input/output pins of the XC835/836.

**Table 8 Input/Output Characteristics (Operating Conditions apply)**

4)  $V_{DDPSRR}$  and  $V_{DDCSRR}$  must be met before the system reset is released.

5) Detection is enabled via SDCON register in active mode. It is automatically disabled in power down mode.

### 3.2.3 ADC Characteristics

But in this case, analog parameters may show a reduced performance. In the reduced voltage mode ( $2.5\text{ V} < V_{DDP} < 3\text{ V}$ ), the ADC is not recommended to be used.

1) 1.2 V at  $V_{DDP} = 3.0\text{ V}$ .

2) Not subject to production test, verified at CPU clock ( $f_{SCLK, CCLK}$ ) = 8 MHz,  $T_A = +25\text{ }^\circ\text{C}$  and  $V_{DDP} = 5\text{ V}$ .

3) TUE is tested at  $V_{AREF} = V_{DDP} = 5.0\text{ V}$  and CPU clock ( $f_{SCLK, CCLK}$ ) = 8 MHz.

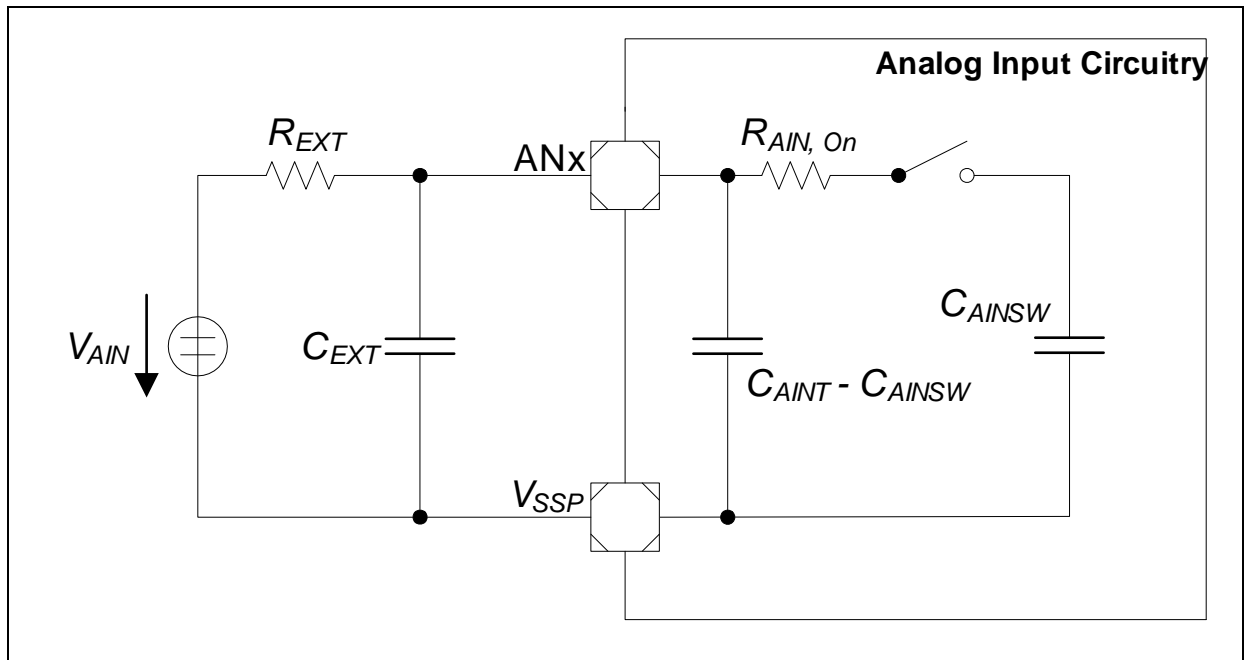

4) Not subject to production test, verified by design/characterization.

5) If a reduced positive reference voltage is used, TUE will increase. If the positive reference is reduced by a factor of K, the TUE will increased by 1/K. Example:K = 0.8, 1/K = 1.25; 1.25 X TUE = 2.5 LSB10.

6) The sampling capacity of the conversion C-Network is pre-charged to  $V_{AREF}/2$  before connecting the input to the C-Network. Because of the parasitic elements, the voltage measured at ANx is lower than  $V_{AREF}/2$ .

### 3.2.4 Flash Memory Parameters

The XC835/836 is delivered with all Flash sectors erased (read all zeros).

The data retention time of the XC835/836's Flash memory (i.e. the time after which stored data can still be retrieved) depends on the number of times the Flash memory has been erased and programmed.

*Note: Flash memory parameters are not subject to production test but verified by design and/or characterization.*

**Table 12 Flash Timing Parameters (Operating Conditions apply)**

Parameter	Symbol	CC	Limit Values			Unit	Remarks
			Min.	Typ.	Max.		
Read access time (per byte)	$t_{ACC}$	CC	–	125	–	ns	
Programming time (per wordline)	$t_{PR}$	CC	–	2.2	–	ms	
Erase time (one or more sectors)	$t_{ER}$	CC	–	120	–	ms	
Flash wait states	$N_{WSFLASH}$	CC	0				CPU clock = 8 MHz
			1				CPU clock = 24 MHz

**Table 13 Flash Data Retention and Endurance (Operating Conditions apply)**

Retention	Endurance <sup>1)</sup>	Size	Remarks
20 years	1,000 cycles	up to 8 Kbytes	
5 years	10,000 cycles	1 Kbyte	
2 years	70,000 cycles	512 bytes	
2 years	100,000 cycles	128 bytes	

1) One cycle refers to the programming of all wordlines in a sector and erasing of sector. The Flash endurance data specified in **Table 13** is valid only if the following conditions are fulfilled:

- the maximum number of erase cycles per Flash sector must not exceed 100,000 cycles.
- the maximum number of erase cycles per Flash bank must not exceed 300,000 cycles.
- the maximum number of program cycles per Flash bank must not exceed 2,500,000 cycles.

**Table 14 Emulated Flash Data Retention and Endurance based on EEPROM Emulation ROM Library (Operating Conditions apply)**

Retention	Endurance <sup>1)</sup>	Emulation Size	Remarks
2 years	1,600,000 cycles	31 bytes	
2 years	1,400,000 cycles	62 bytes	
2 years	1,200,000 cycles	93 bytes	
2 years	1,000,000 cycles	124 bytes	

1) These values show the maximum endurance. Maximum endurance is the maximum possible unique data write if each data update is only 31 bytes. Minimum endurance cycle is the maximum possible unique data write if each data update is the same as the emulation size. The minimum endurance cycle can be calculated using the formulae [(max. endurance)\*(31)/(emulation size)].

## 4 Package and Quality Declaration

Chapter 4 provides the information of the XC835/836 package and reliability section.

### 4.1 Package Parameters

Table 24 provides the thermal characteristics of the packages used in XC835 and XC836 respectively.

**Table 24 Thermal Characteristics of the Packages**

Parameter	Symbol		Limit Values		Unit	Package Types
			Min.	Max.		
Thermal resistance junction case <sup>1)</sup>	$R_{TJC}$	CC	-	30.8	K/W	PG-DSO-24-1
			-	27.0	K/W	PG-TSSOP-28-1
			-	20.2	K/W	PG-TSSOP-28-12
Thermal resistance junction lead <sup>1)</sup>	$R_{TJL}$	CC	-	30.5	K/W	PG-DSO-24-1
			-	195.3	K/W	PG-TSSOP-28-1
			-	41	K/W	PG-TSSOP-28-12

1) The thermal resistances between the case and the ambient ( $R_{TCA}$ ), the lead and the ambient ( $R_{TLA}$ ) are to be combined with the thermal resistances between the junction and the case ( $R_{TJC}$ ), the junction and the lead ( $R_{TJL}$ ) given above, in order to calculate the total thermal resistance between the junction and the ambient ( $R_{TJA}$ ). The thermal resistances between the case and the ambient ( $R_{TCA}$ ), the lead and the ambient ( $R_{TLA}$ ) depend on the external system (PCB, case) characteristics, and are under user responsibility.

The junction temperature can be calculated using the following equation:  $T_J = T_A + R_{TJA} \times P_D$ , where the  $R_{TJA}$  is the total thermal resistance between the junction and the ambient. This total junction ambient resistance  $R_{TJA}$  can be obtained from the upper four partial thermal resistances, by

- simply adding only the two thermal resistances (junction lead and lead ambient), or
- by taking all four resistances into account, depending on the precision needed.
