

BFP780

High linearity RF medium power transistor

Product description

The BFP780 is a single stage high linearity and high gain driver amplifier based on NPN silicon germanium technology.

Feature list

- High maximum RF input power $P_{RFIn,max} = 20$ dBm
- Minimum noise figure $NF_{min} = 1.2$ dB at 900 MHz, 5 V, 30 mA
- $OIP_3 = 34.5$ dBm at 900 MHz, 5 V, 90 mA
- $OP_{1dB} = 23$ dBm at 900 MHz, 5 V, 90 mA

Product validation

Qualified for industrial applications according to the relevant tests of JEDEC47/20/22.

Potential applications

- Commercial and industrial wireless infrastructure
- ISM band medium power amplifiers and drivers
- Automated test equipment
- UHF television, CATV and DBS

Absolute maximum ratings

1 Absolute maximum ratings

Table 2 Absolute maximum ratings at $T_A = 25\text{ °C}$ (unless otherwise specified)

Parameter	Symbol	Values		Unit	Note or test condition
		Min.	Max.		
Collector emitter voltage	V_{CE}	-	6.1 5.1	V	$T_A = 25\text{ °C}$ $T_A = -40\text{ °C}$
Collector base voltage	V_{CB}		15		-
Instantaneous total collector current	i_C		240	mA	DC + RF swing
DC collector current	I_C		120		
DC base current	I_B	-1	5		
RF input power	P_{RFIn}	-	20	dBm	In- and output matched
Dissipated power	P_{diss}		600		
Junction temperature	T_J		150	°C	-
Operating case temperature	T_A		-40		
Storage temperature	T_{Stg}	-55	150		

Attention: *Stresses above the max. values listed here may cause permanent damage to the device. Exposure to absolute maximum rating conditions for extended periods may affect device reliability. Maximum ratings are absolute ratings; exceeding only one of these values may cause irreversible damage to the component.*

¹ T_S is the soldering point temperature. T_S is measured on the emitter lead at the soldering point of the PCB.

² At the same time regard $T_{J,max}$.

Recommended operating conditions

2 Recommended operating conditions

The following table shows examples of recommended operating conditions. As long as maximum ratings are regarded, operation outside these conditions is permitted, but it may increase failure rate and reduce lifetime. For further information refer to the quality report available on the BFP780 product page.

Table 3 Recommended operating conditions

¹ Is the operating case temperature respectively of the heatsink.

² $P_{DC} = V_{CE} \cdot I_C$ with $V_{CE} = 5$ V.

³ RF power delivered to the load, $P_{RFout} = \eta \cdot P_{DC}$.

⁴ Efficiency of the conversion from DC power to RF power, $\eta = P_{RFout} / P_{DC}$ (collector efficiency).

⁵ $P_{diss} = P_{DC} - P_{RFout}$. The RF output power P_{RFout} delivered to the load reduces the power P_{diss} to be dissipated by the device. This means a good output match is recommended.

⁶ R_{thSA} is the thermal resistance of the PCB including heat sink, that is between the soldering point S and the ambient A. Regard the impact of R_{thSA} on the junction temperature T_J , see below. The thermal design of the PCB, respectively R_{thSA} , has to be adjusted to the intended operating mode.

⁷ $T_J = T_A + P_{diss} \cdot R_{thJA}$.

$R_{thJA} = R_{thJS} + R_{thSA}$.

R_{thJA} is the thermal resistance between the transistor junction J and the ambient A.

R_{thJS} is the combined thermal resistance of die and package, which is 95 K/W for BFP780, see [Chapter 3](#).

Parameter	Symbol	Values			Unit	Note or test condition
		Min.	Typ.	Max.		
Junction - soldering point	R_{thJS}	-	95	-	K/W	-

Figure 1 Absolute maximum power dissipation $P_{diss,max} = f(T_S)$

Note: In the horizontal part of the derating curve the maximum power dissipation is given by $P_{diss,max} \approx V_{CE,max} \cdot I_{C,max}$. In this part, the junction temperature T_J is lower than $T_{J,max}$. In the declining slope, it is $T_J = T_{J,max}$. $P_{diss,max}$ has to be reduced according to the curve in order not to exceed $T_{J,max}$. It is $T_{J,max} = T_S + P_{diss,max} \cdot R_{thJS}$.

Collector emitter capacitance	C_{CE}		1.4			$V_{CE} = 5\text{ V}$, $V_{BE} = 0\text{ V}$, $f = 1\text{ MHz}$, base grounded
Emitter base capacitance	C_{EB}		3.3			$V_{EB} = 0.5\text{ V}$, $V_{CB} = 0\text{ V}$, $f = 1\text{ MHz}$, collector grounded

¹ Accuracy is not limited by the device but by the cycle time of the 100% test.

² Test duration 14 ms, duty cycle 46%. Regard that the current gain h_{FE} depends on the junction temperature T_J and T_J amongst others from the thermal resistance R_{thSA} of the PCB, see notes on [Table 3](#). Hence the h_{FE} specified in this data sheet must not be the same as in the application. It is recommended to apply circuit design techniques to make the collector current I_C independent on the h_{FE} production variation and temperature effects.

Electrical performance in test fixture

Measurement setup for the AC characteristics shown in [Table 7](#) to [Table 10](#) is a test fixture with Bias-T's and tuners to adjust the source and load impedance in a 50 Ω system. $T_A = 25\text{ °C}$.

Figure 4 DC Current gain $h_{FE} = f(I_C), V_{CE} = 5 \text{ V}$

Electrical performance in test fixture

Figure 5 Collector emitter breakdown voltage $V_{(BR)CER} = f(R_{BE})$

Note: The above figure shows the collector-emitter breakdown voltage $V_{(BR)CER}$ with a resistor R_{BE} between base and emitter. Only for very high R_{BE} values ("open base") the breakdown voltage $V_{(BR)CER}$ is as low as $V_{(BR)CEO}$ (here 6.6 V). With decreasing R_{BE} values $V_{(BR)CER}$ increases, e.g. at $R_{BE} = 10\text{ k}\Omega$ to $V_{(BR)CEO} = 10\text{ V}$. In the application the biasing base resistance together with block capacitors take over the function of R_{BE} and allows the RF voltage amplitude to swing up to voltages much higher than $V_{(BR)CEO}$, without clipping. Due to this effect the transistor can be biased at $V_{CE} = 5\text{ V}$ and still high RF output powers achieved, see the OP_{1dB} values reported in [Chapter 4.2](#).
