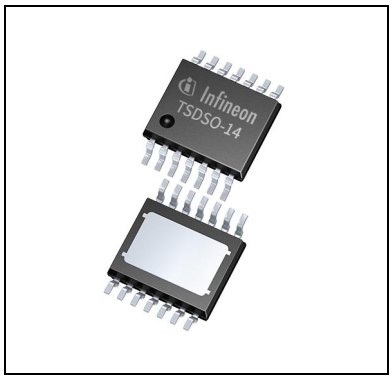
BTS7010-1EPA

PROFET™ +2 12V **1x 10 mΩ**

Smart High-Side Power Switch

AEC Qualified RoHS

Package	PG-TSDSO-14
Marking	7010-1A



1 Overview

Potential Applications

- Suitable for resistive, inductive and capacitive loads
- Replaces electromechanical relays, fuses and discrete circuits
- Driving capability suitable for 9 A loads and high inrush current loads such as H7 55W / Xenon 55W lamps or equivalent electronic loads (e.g. LED modules)

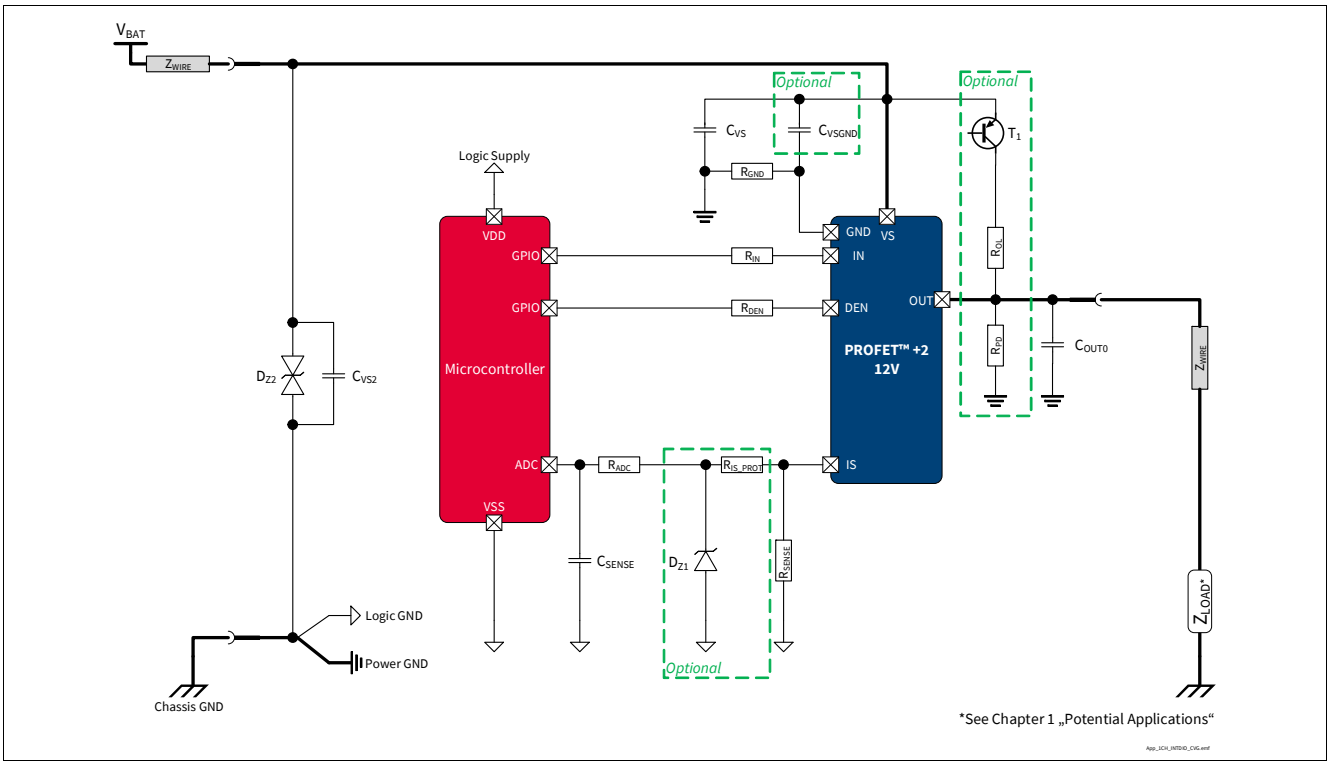


Figure 1 BTS7010-1EPA Application Diagram. Further information in Chapter 10

Overview

Basic Features

- High-Side Switch with Diagnosis and Embedded Protection
- Part of PROFET™ +2 12V Family
- ReverseON for low power dissipation in Reverse Polarity
- Switch ON capability while Inverse Current condition (InverseON)
- Green Product (RoHS compliant)

Protection Features

- Absolute and dynamic temperature limitation with controlled restart
- Overcurrent protection (tripping) with Intelligent Restart Control
- Undervoltage shutdown
- Overvoltage protection with external components

Diagnostic Features

- Proportional load current sense
- Open Load in ON and OFF state
- Short circuit to ground and battery

Product Validation

Qualified for automotive applications. Product validation according to AEC-Q100 Grade 1.

Description

The BTS7010-1EPA is a Smart High-Side Power Switch, providing protection functions and diagnosis. The device is integrated in SMART7 technology.

Table 1 Product Summary

Parameter	Symbol	Values
Minimum Operating voltage (at switch ON)	$V_{S(OP)}$	4.1 V
Minimum Operating voltage (cranking)	$V_{S(UV)}$	3.1 V
Maximum Operating voltage	V_S	28 V
Minimum Overvoltage protection ($T_J \geq 25$ °C)	$V_{DS(CLAMP)\_25}$	35 V
Maximum current in Sleep mode ($T_J \leq 85$ °C)	$I_{VS(SLEEP)\_85}$	0.5 µA
Maximum operative current	$I_{GND(ACTIVE)}$	4 mA
Maximum ON-state resistance ($T_J = 150$ °C)	$R_{DS(ON)\_150}$	19.5 mΩ
Nominal load current ($T_A = 85$ °C)	$I_{L(NOM)}$	9 A
Typical current sense ratio at $I_L = I_{L(NOM)}$	k_{ILIS}	5000

2 Block Diagram and Terms

2.1 Block Diagram

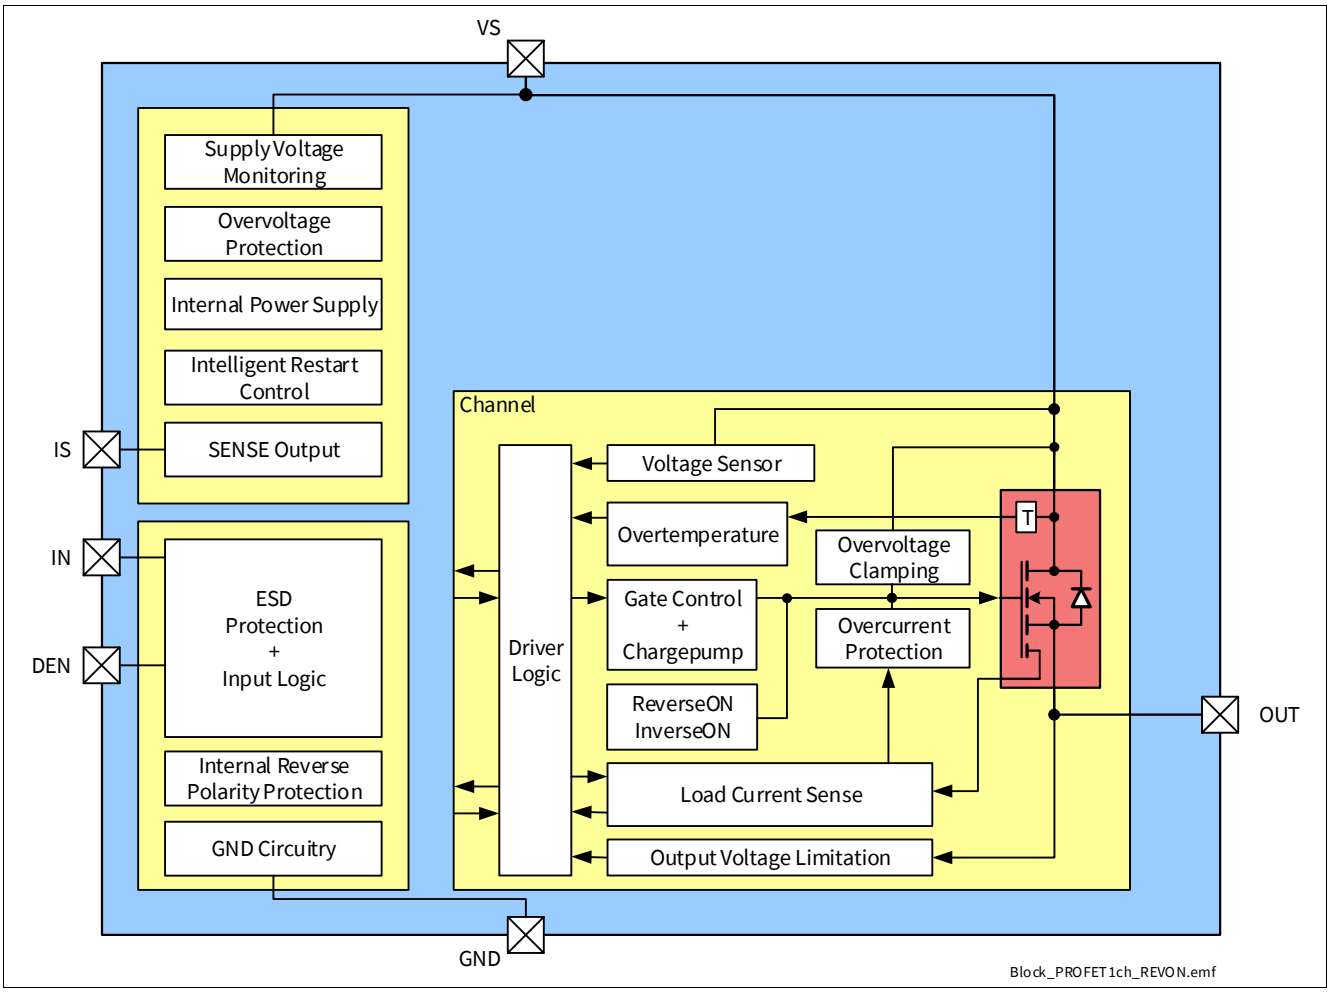

Figure 2 Block Diagram of BTS7010-1EPA

2.2 Terms

Figure 3 shows all terms used in this data sheet, with associated convention for positive values.

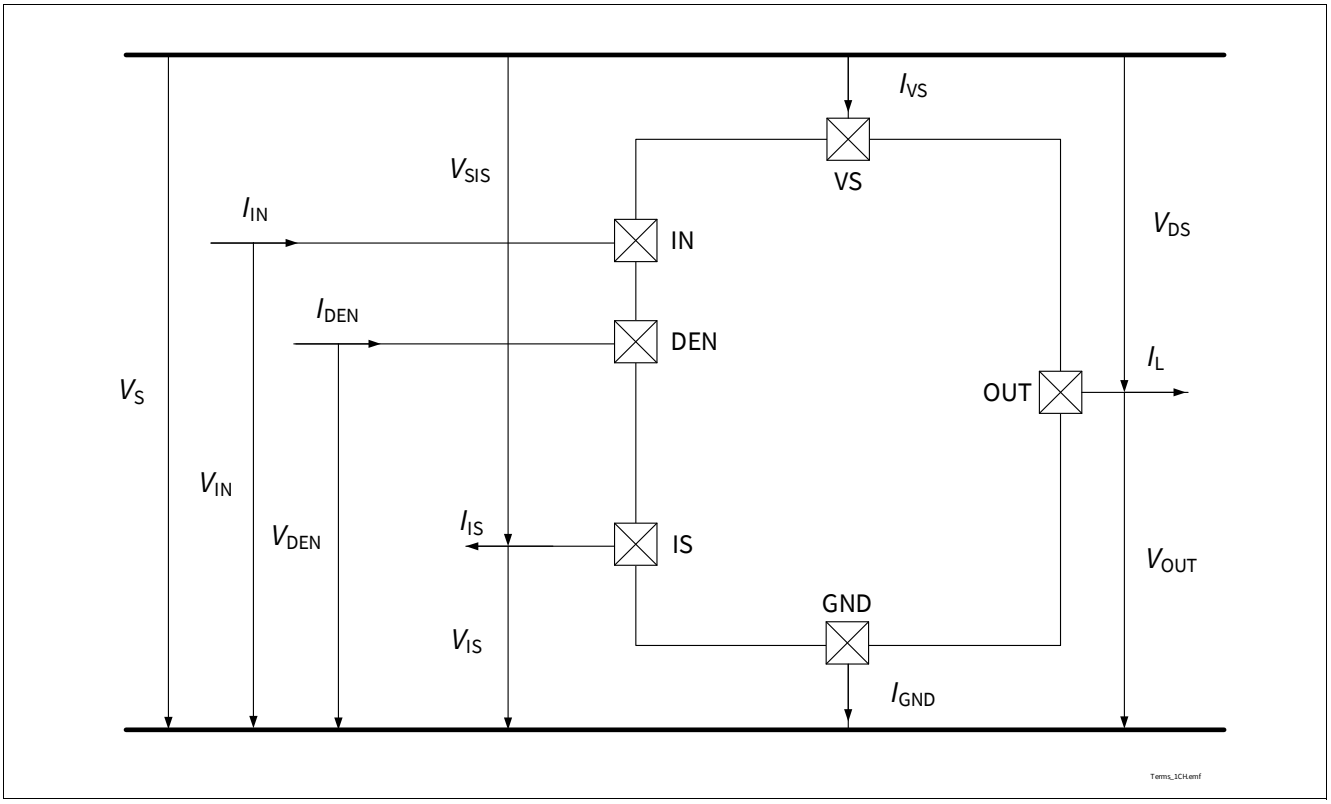

Figure 3 Voltage and Current Convention

3 Pin Configuration

3.1 Pin Assignment

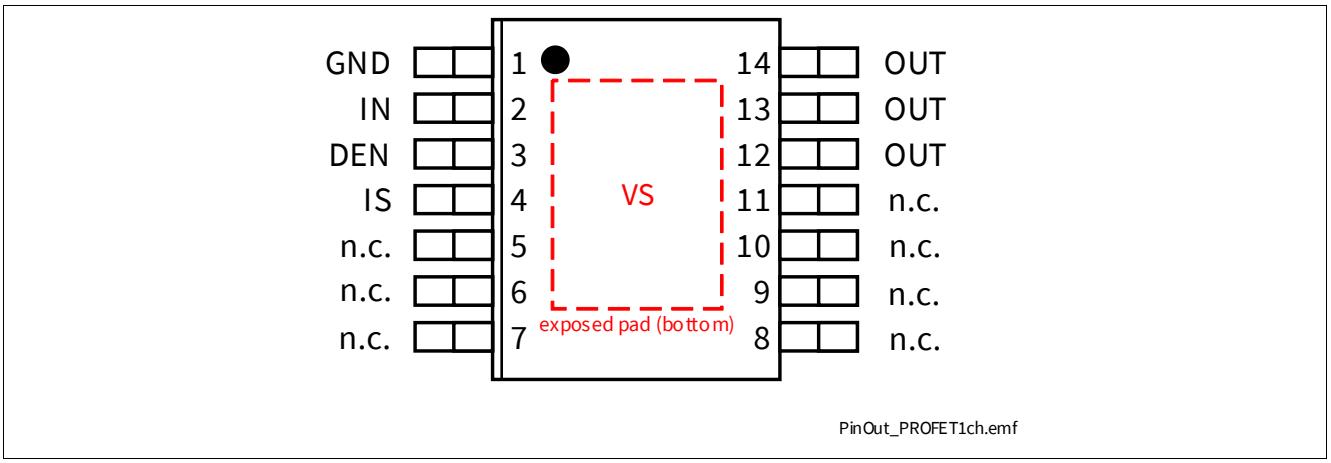

Figure 4 Pin Configuration

3.2 Pin Definitions and Functions

Table 2 Pin Definition

Pin	Symbol	Function
EP	VS (exposed pad)	**Supply Voltage** Battery voltage
1	GND	**Ground** Signal ground
2	IN	**Input Channel** Digital signal to switch ON the channel (“high” active) If not used: connect with a 10 kΩ resistor either to GND pin or to module ground
3	DEN	**Diagnostic Enable** Digital signal to enable device diagnosis (“high” active) and to clear the protection counter of channel If not used: connect with a 10 kΩ resistor either to GND pin or to module ground
4	IS	**SENSE current output** Analog/digital signal for diagnosis If not used: left open
5-7, 8-11	n.c.	Not connected, internally not bonded
12-14	OUT	**Output** Protected high-side power output channel[1)]

1) All output pins of the channel must be connected together on the PCB. All pins of the output are internally connected together. PCB traces have to be designed to withstand the maximum current which can flow.

4 General Product Characteristics

4.1 Absolute Maximum Ratings - General

Table 3 Absolute Maximum Ratings[1)]

T_J = -40 °C to +150 °C; all voltages with respect to ground, positive current flowing into pin (unless otherwise specified)

Parameter	Symbol	Values			Unit	Note or Test Condition	Number
		Min.	Typ.	Max.			
Supply pins							
Power Supply Voltage	V_S	-0.3	–	28	V	–	P_4.1.0.1
Load Dump Voltage	$V_{BAT(LD)}$	–	–	35	V	suppressed Load Dump acc. to ISO16750-2 (2010). R_i = 2 Ω	P_4.1.0.3
Supply Voltage for Short Circuit Protection	$V_{BAT(SC)}$	0	–	24	V	Setup acc. to AEC-Q100-012	P_4.1.0.25
Reverse Polarity Voltage	$-V_{BAT(REV)}$	–	–	16	V	$t \leq 2$ min T_A = +25 °C Setup as described in **Chapter 10**	P_4.1.0.5
Current through GND Pin	I_{GND}	-50	–	50	mA	R_{GND} according to **Chapter 10**	P_4.1.0.9
Logic & control pins (Digital Input = DI) DI = IN, DEN, DSEL							
Current through DI Pin	I_{DI}	-1	–	2	mA	2)	P_4.1.0.14
Current through DI Pin Reverse Battery Condition	$I_{DI(REV)}$	-1	–	10	mA	2) $t \leq 2$ min	P_4.1.0.36
IS pin							
Voltage at IS Pin	V_{IS}	-1.5	–	V_S	V	I_{IS} = 10 µA	P_4.1.0.16
Current through IS Pin	I_{IS}	-25	–	$I_{IS(SAT),MAX}$	mA	–	P_4.1.0.18
Temperatures							
Junction Temperature	T_J	-40	–	150	°C	–	P_4.1.0.19
Storage Temperature	T_{STG}	-55	–	150	°C	–	P_4.1.0.20

Table 3 Absolute Maximum Ratings[1)] (continued)

T_J = -40 °C to +150 °C; all voltages with respect to ground, positive current flowing into pin (unless otherwise specified)

Parameter	Symbol	Values			Unit	Note or Test Condition	Number
		Min.	Typ.	Max.			
ESD Susceptibility							
ESD Susceptibility all Pins (HBM)	$V_{ESD(HBM)}$	-2	–	2	kV	HBM[3)]	P_4.1.0.21
ESD Susceptibility OUT vs GND and VS connected (HBM)	$V_{ESD(HBM)\_OUT}$	-4	–	4	kV	HBM[3)]	P_4.1.0.22
ESD Susceptibility all Pins (CDM)	$V_{ESD(CDM)}$	-500	–	500	V	CDM[4)]	P_4.1.0.23
ESD Susceptibility Corner Pins (CDM) (pins 1, 7, 8, 14)	$V_{ESD(CDM)\_CRN}$	-750	–	750	V	CDM[4)]	P_4.1.0.24

1) Not subject to production test - specified by design.
2) Maximum V_{DI} to be considered for Latch-Up tests: 5.5 V.
3) ESD susceptibility, Human Body Model “HBM”, according to AEC Q100-002.
4) ESD susceptibility, Charged Device Model “CDM”, according to AEC Q100-011.

Notes

1. *Stresses above the ones listed here may cause permanent damage to the device. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.*
2. *Integrated protection functions are designed to prevent IC destruction under fault conditions described in the data sheet. Fault conditions are considered as “outside” normal operating range. Protection functions are not designed for continuous repetitive operation.*

4.2 Absolute Maximum Ratings - Power Stages

4.2.1 Power Stage - 10 mΩ

Table 4 Absolute Maximum Ratings[1)]

T_J = -40 °C to +150 °C; all voltages with respect to ground, positive current flowing into pin (unless otherwise specified)

Parameter	Symbol	Values			Unit	Note or Test Condition	Number
		Min.	Typ.	Max.			
Maximum Energy Dissipation Single Pulse	E_{AS}	–	–	55	mJ	$I_L = 2*I_{L(NOM)}$ $T_{J(0)}$ = 150 °C V_S = 28 V	P_4.2.2.5
Maximum Energy Dissipation Repetitive Pulse	E_{AR}	–	–	17	mJ	$I_L = I_{L(NOM)}$ $T_{J(0)}$ = 85 °C V_S = 13.5 V 1M cycles	P_4.2.2.6
Load Current	$\|I_L\|$	–	–	$I_{L(OVL),MAX}$	A	–	P_4.2.2.3

1) Not subject to production test - specified by design.

4.3 Functional Range

Table 5 Functional Range - Supply Voltage and Temperature[1)]

Parameter	Symbol	Values			Unit	Note or Test Condition	Number
		Min.	Typ.	Max.			
Supply Voltage Range for Normal Operation	$V_{S(NOR)}$	6	13.5	18	V	–	P_4.3.0.1
Lower Extended Supply Voltage Range for Operation	$V_{S(EXT,LOW)}$	3.1	–	6	V	[2)3)] (parameter deviations possible)	P_4.3.0.2
Supply Voltage Range reached after Overload Protection activation leading to "Undervoltage on V_S" condition	$V_{S(EXT,CVG)}$	–	–	3.1	V	C_{VSGND} is required when the Overload Protection is triggered (see **Chapter 8.2**) and the observed number of retries is different from what specified in **Chapter 8.3.1**	P_4.3.0.7

Table 5 Functional Range - Supply Voltage and Temperature[1)] (continued)

Parameter	Symbol	Values			Unit	Note or Test Condition	Number
		Min.	Typ.	Max.			
Upper Extended Supply Voltage Range for Operation	$V_{S(EXT,UP)}$	18	–	28	V	[3)] (parameter deviations possible)	P_4.3.0.3
Junction Temperature	T_J	-40	–	150	°C	–	P_4.3.0.5

1) Not subject to production test - specified by design.
2) In case of V_S voltage decreasing: $V_{S(EXT,LOW),MIN}$ = 3.1 V. In case of V_S voltage increasing: $V_{S(EXT,LOW),MIN}$ = 4.1 V.
3) Protection functions still operative.

Note: Within the functional or operating range, the IC operates as described in the circuit description. The electrical characteristics are specified within the conditions given in the Electrical Characteristics tables.

4.4 Thermal Resistance

*Note: This thermal data was generated in accordance with JEDEC JESD51 standards. For more information, go to **www.jedec.org**.*

Table 6 Thermal Resistance[1)]

Parameter	Symbol	Values			Unit	Note or Test Condition	Number
		Min.	Typ.	Max.			
Thermal Characterization Parameter Junction-Top	Ψ_{JTOP}	–	2.5	4	K/W	[2)]	P_4.4.0.1
Thermal Resistance Junction-to-Case	R_{thJC}	–	1.9	3.1	K/W	[2)] simulated at exposed pad	P_4.4.0.2
Thermal Resistance Junction-to-Ambient	R_{thJA}	–	33.2	–	K/W	[2)]	P_4.4.0.3

1) Not subject to production test - specified by design.
2) According to Jedec JESD51-2,-5,-7 at natural convection on FR4 2s2p board; the Product (Chip + Package) was simulated on a 76.2 × 114.3 × 1.5 mm board with 2 inner copper layers (2 × 70 µm Cu, 2 × 35 µm Cu). Where applicable a thermal via array under the exposed pad contacted the first inner copper layer. Simulation done at T_A = 105°C, $P_{DISSIPATION}$ = 1 W.

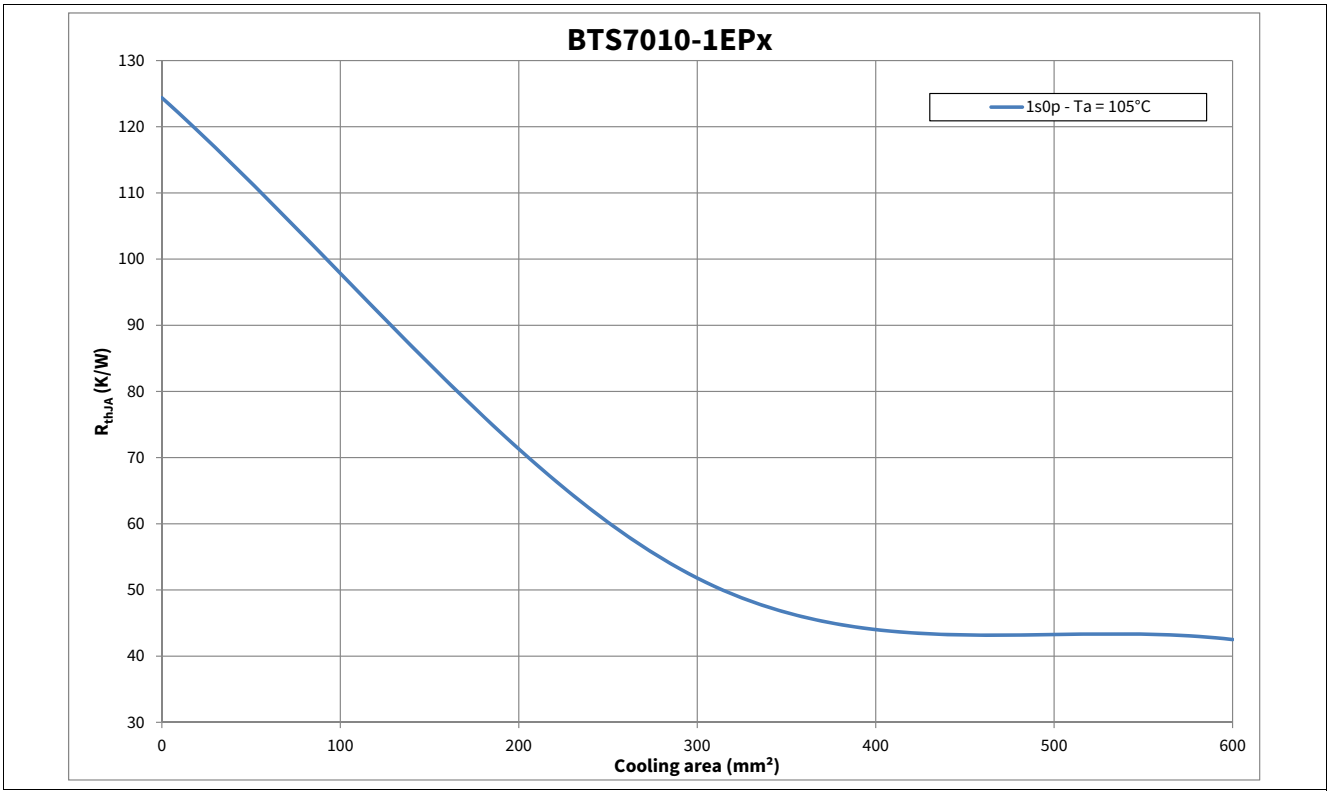

Figure 10 Thermal Resistance on 1s0p PCB with various cooling surfaces

5 Logic Pins

The device has 2 digital pins.

5.1 Input Pin (IN)

The input pin IN activates the output channel. The input circuitry is compatible with 3.3V and 5V microcontroller (see **Chapter 10** for the complete application setup overview). The electrical equivalent of the input circuitry is shown in **Figure 11**. In case the pin is not used, it must be connected with a 10 kΩ resistor either to GND pin or to module ground.

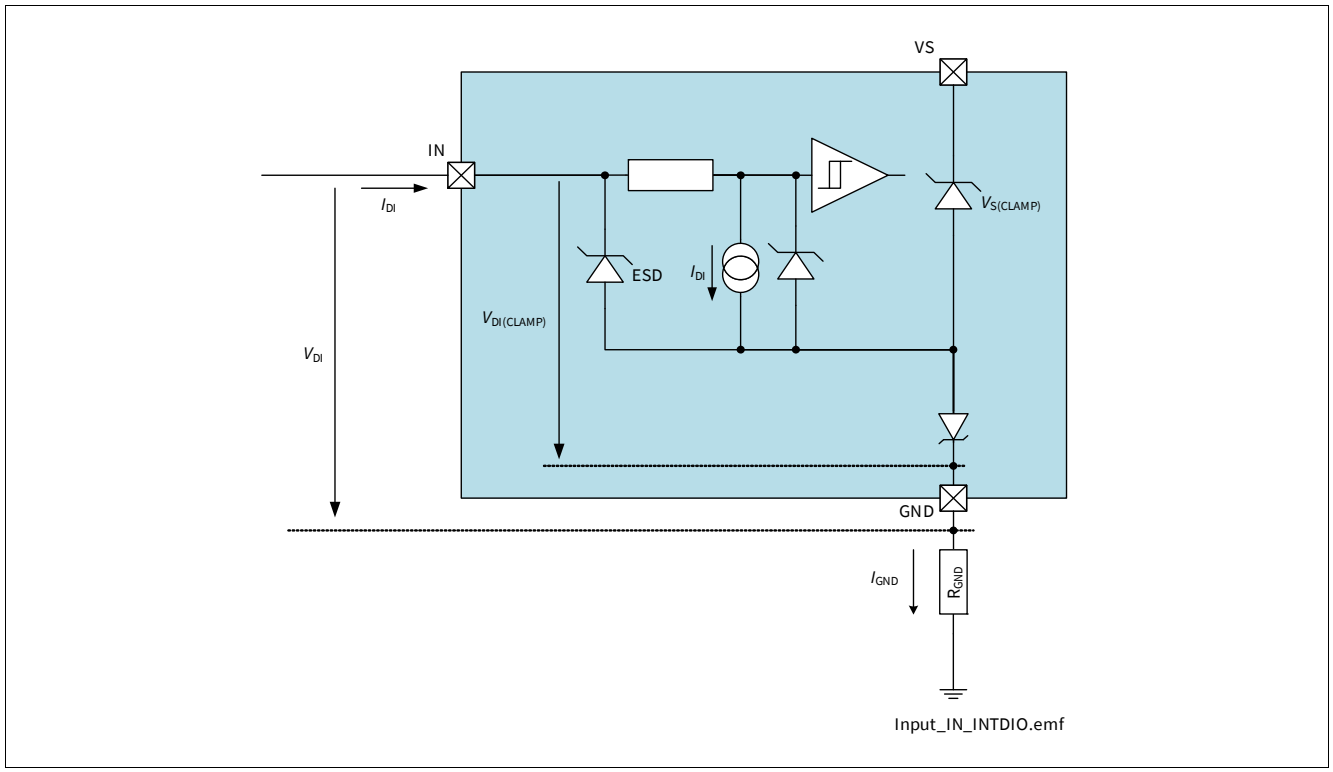

Figure 11 Input circuitry

The logic thresholds for “low” and “high” states are defined by parameters $V_{DI(TH)}$ and $V_{DI(HYS)}$. The relationship between these two values is shown in **Figure 12**. The voltage V_{IN} needed to ensure a “high” state is always higher than the voltage needed to ensure a “low” state.

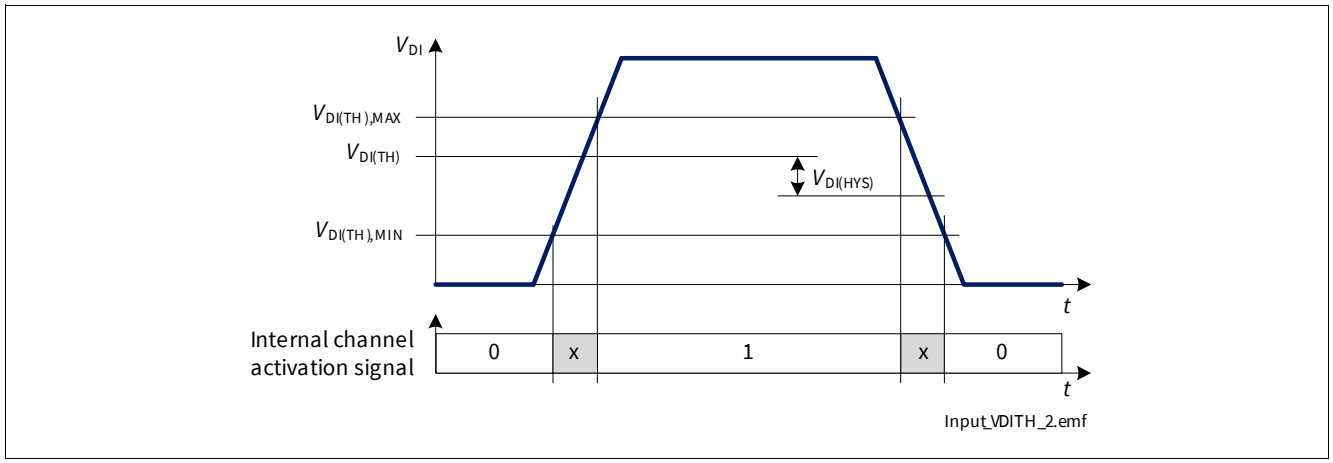

Figure 12 Input Threshold voltages and hysteresis

5.2 Diagnosis Pin

The Diagnosis Enable (DEN) pin controls the diagnosis circuitry and the protection circuitry. When DEN pin is set to “high”, the diagnosis is enabled (see **Chapter 9.2** for more details). When it is set to “low”, the diagnosis is disabled (IS pin is set to high impedance).

The transition from “high” to “low” of DEN pin clears the protection latch of the channel depending on the logic state of IN pin and DEN pulse length (see **Chapter 8.3** for more details). The internal structure of diagnosis pins is the same as the one of input pins. See **Figure 11** for more details.

5.3 Electrical Characteristics Logic Pins

V_S = 6 V to 18 V, T_J = -40 °C to +150 °C
Typical values: V_S = 13.5 V, T_J = 25 °C

Digital Input (DI) pins = IN, DEN

Table 7 Electrical Characteristics: Logic Pins - General

Parameter	Symbol	Values			Unit	Note or Test Condition	Number
		Min.	Typ.	Max.			
Digital Input Voltage Threshold	$V_{DI(TH)}$	0.8	1.3	2	V	See **Figure 11** and **Figure 12**	P_5.4.0.1
Digital Input Clamping Voltage	$V_{DI(CLAMP1)}$	–	7	–	V	1) I_{DI} = 1 mA See **Figure 11** and **Figure 12**	P_5.4.0.2
Digital Input Clamping Voltage	$V_{DI(CLAMP2)}$	6.5	7.5	8.5	V	I_{DI} = 2 mA See **Figure 11** and **Figure 12**	P_5.4.0.3
Digital Input Hysteresis	$V_{DI(HYS)}$	–	0.25	–	V	1) See **Figure 11** and **Figure 12**	P_5.4.0.4
Digital Input Current (“high”)	$I_{DI(H)}$	2	10	25	µA	V_{DI} = 2 V See **Figure 11** and **Figure 12**	P_5.4.0.5
Digital Input Current (“low”)	$I_{DI(L)}$	2	10	25	µA	V_{DI} = 0.8 V See **Figure 11** and **Figure 12**	P_5.4.0.6

1) Not subject to production test - specified by design.

6 Power Supply

The BTS7010-1EPA is supplied by V_S, which is used for the internal logic as well as supply for the power output stages. V_S has an undervoltage detection circuit, which prevents the activation of the power output stage and diagnosis in case the applied voltage is below the undervoltage threshold.

6.1 Operation Modes

BTS7010-1EPA has the following operation modes:

- Sleep mode
- Active mode
- Stand-by mode

The transition between operation modes is determined according to these variables:

- Logic level at IN pin
- Logic level at DEN pin

The state diagram including the possible transitions is shown in **Figure 13**. The behavior of BTS7010-1EPA as well as some parameters may change in dependence from the operation mode of the device. Furthermore, due to the undervoltage detection circuitry which monitors V_S supply voltage, some changes within the same operation mode can be seen accordingly.

There are three parameters describing each operation mode of BTS7010-1EPA:

- Status of the output channel
- Status of the diagnosis
- Current consumption at VS pin (measured by I_{VS} in Sleep mode, I_{GND} in all other operative modes)

Table 8 shows the correlation between operation modes, V_S supply voltage, and the state of the most important functions (channel status, diagnosis).

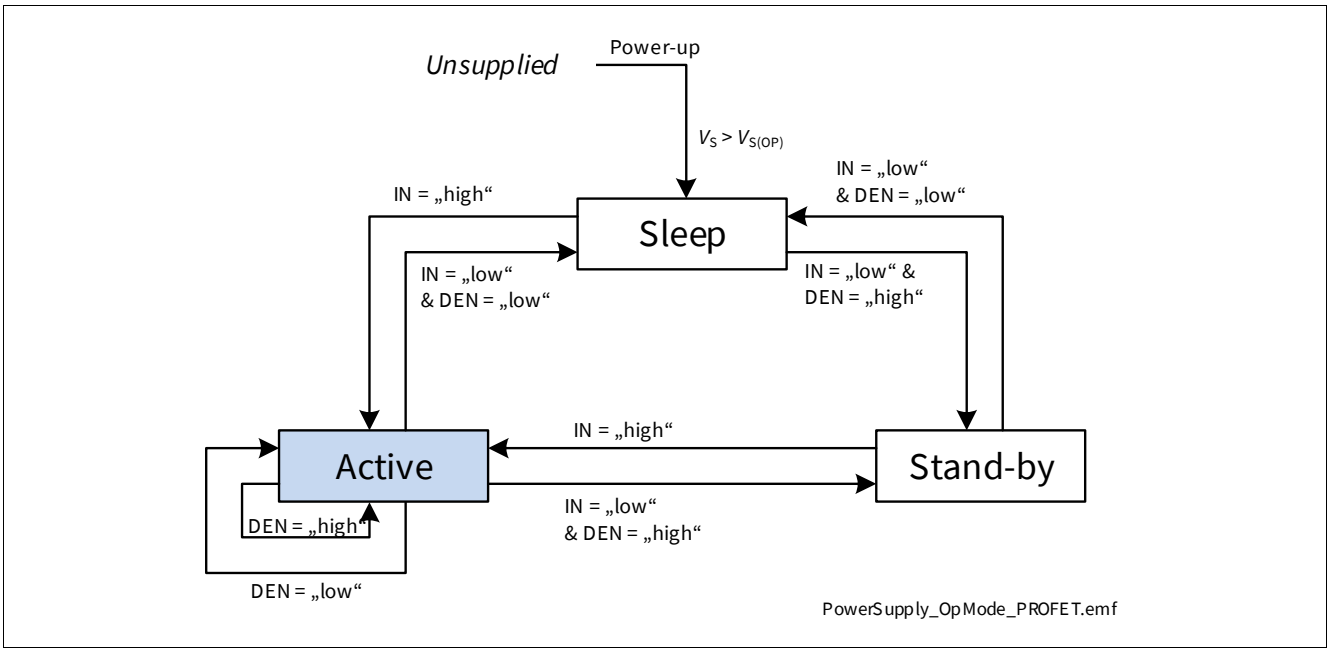

Figure 13 Operation Mode State Diagram

Table 8 Device function in relation to operation modes and V_S voltage

Operative Mode	Function	V_S in undervoltage	V_S not in undervoltage
Sleep	Channel	OFF	OFF
	Diagnosis	OFF	OFF
Active	Channel	OFF	available
	Diagnosis	OFF	available in OFF and ON states
Stand-by	Channel	OFF	OFF
	Diagnosis	OFF	available in OFF state

6.1.1 Unsupplied

In this state, the device is either unsupplied (no voltage applied to VS pin) or the supply voltage is below the undervoltage threshold.

6.1.2 Power-up

The Power-up condition is entered when the supply voltage (V_S) is applied to the device. The supply is rising until it is above the undervoltage threshold $V_{S(OP)}$ therefore the internal Power-On signals are set.

6.1.3 Sleep mode

The device is in Sleep mode when all Digital Input pins (IN, DEN) are set to “low”. When BTS7010-1EPA is in Sleep mode, the output is OFF. The current consumption is minimum (see parameter $I_{VS(SLEEP)}$). No Overtemperature or Overload protection mechanism is active when the device is in Sleep mode. The device can go in Sleep mode only if the protection is not active (counter = 0, see **Chapter 8.3.1** for further details).

6.1.4 Stand-by mode

The device is in Stand-by mode as long as DEN pin is set to “high” while input pin is set to “low”. All channels are OFF therefore only Open Load in OFF diagnosis is possible. Depending on the load condition, either a fault current $I_{IS(FAULT)}$ or an Open Load in OFF current $I_{IS(OLOFF)}$ may be present at IS pin. In such situation, the current consumption of the device is increased.

6.1.5 Active mode

Active mode is the normal operation mode of BTS7010-1EPA. The device enters Active mode as soon as IN pin is set to “high”. Device current consumption is specified with $I_{GND(ACTIVE)}$ (measured at GND pin because the current at VS pin includes the load current). Overload, Overtemperature and Overvoltage protections are active. Diagnosis is available.

6.2 Undervoltage on V_S

Between $V_{S(OP)}$ and $V_{S(UV)}$ the undervoltage mechanism is triggered. If the device is operative (in Active mode) and the supply voltage drops below the undervoltage threshold $V_{S(UV)}$, the internal logic switches OFF the output channel.

As soon as the supply voltage V_S is above the operative threshold $V_{S(OP)}$, if the input pin is set to “high” the channel is switched ON again. The restart is delayed with a time $t_{DELAY(UV)}$ which protects the device in case the undervoltage condition is caused by a short circuit event (according to AEC-Q100-012), as shown in **Figure 14**.

If the device is in Sleep mode and one input is set to “high”, the corresponding channel is switched ON if $V_S > V_{S(OP)}$ without waiting for $t_{DELAY(UV)}$.

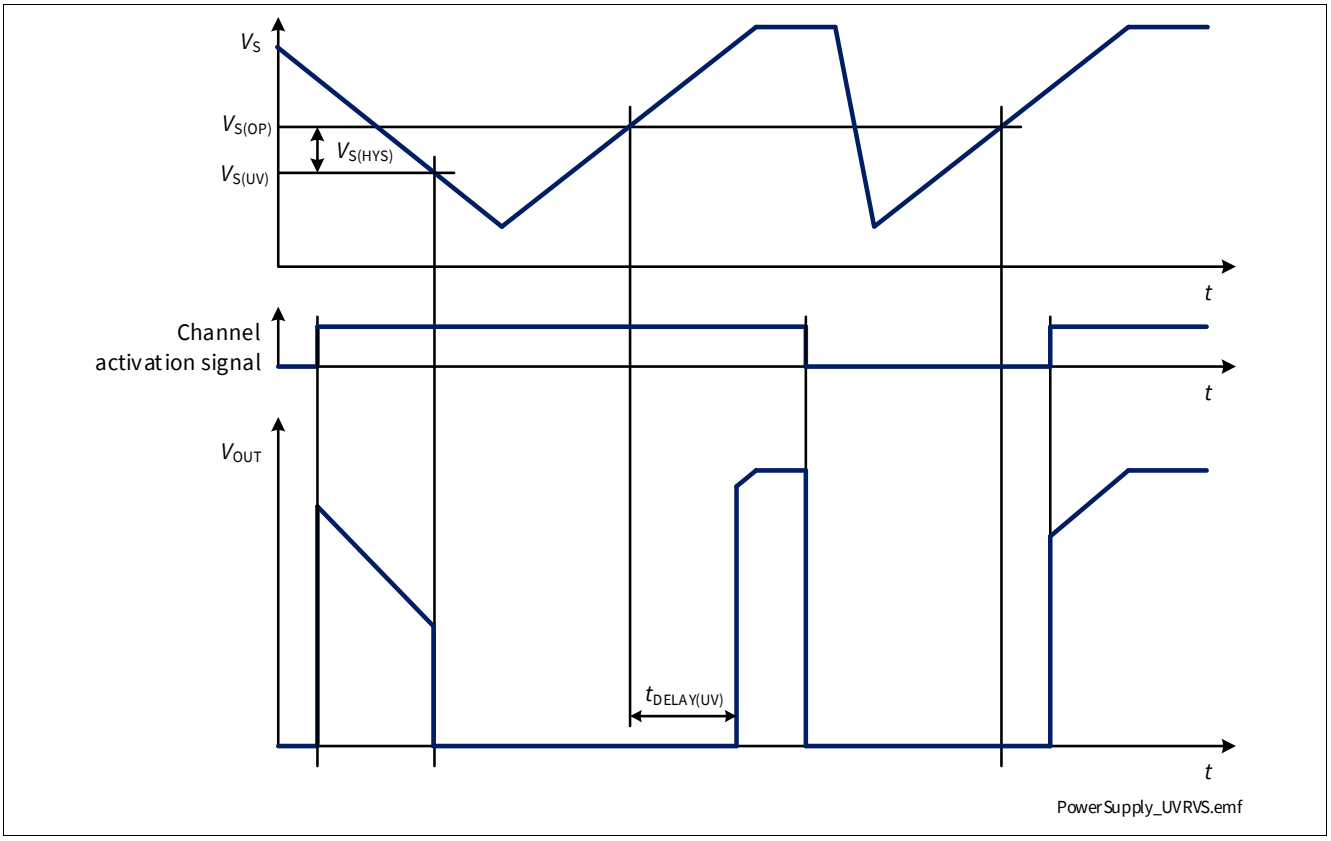

Figure 14 V_S undervoltage behavior

6.3 Electrical Characteristics Power Supply

V_S = 6 V to 18 V, T_J = -40 °C to +150 °C
Typical values: V_S = 13.5 V, T_J = 25 °C

Typical resistive load connected to the output for testing (unless otherwise specified):

R_L = 3.3 Ω

Table 9 Electrical Characteristics: Power Supply - General

Parameter	Symbol	Values			Unit	Note or Test Condition	Number
		Min.	Typ.	Max.			
VS pin							
Power Supply Undervoltage Shutdown	$V_{S(UV)}$	1.8	2.3	3.1	V	V_S decreasing IN = “high” From $V_{DS} \le 0.5$ V to $V_{DS} = V_S$ See **Figure 14**	P_6.4.0.1
Power Supply Minimum Operating Voltage	$V_{S(OP)}$	2.0	3.0	4.1	V	V_S increasing IN = “high” From $V_{DS} = V_S$ to $V_{DS} \le 0.5$ V See **Figure 14**	P_6.4.0.3
Power Supply Undervoltage Shutdown Hysteresis	$V_{S(HYS)}$	–	0.7	–	V	1) $V_{S(OP)} - V_{S(UV)}$ See **Figure 14**	P_6.4.0.6
Power Supply Undervoltage Recovery Time	$t_{DELAY(UV)}$	2.5	5	7.5	ms	$dV_S/dt \le 0.5$ V/µs $V_S \ge -1$ V See **Figure 14**	P_6.4.0.7
Breakdown Voltage between GND and VS Pins in Reverse Battery	$-V_{S(REV)}$	16	–	30	V	1) $I_{GND(REV)}$ = 7 mA T_J = 150 °C	P_6.4.0.9

1) Not subject to production test - specified by design.

6.4 Electrical Characteristics Power Supply - Product Specific

V_S = 6 V to 18 V, T_J = -40 °C to +150 °C
Typical values: V_S = 13.5 V, T_J = 25 °C
Typical resistive load connected to the output for testing (unless otherwise specified):
R_L = 3.3 Ω

6.4.1 BTS7010-1EPA

Table 10 Electrical Characteristics: Power Supply BTS7010-1EPA

Parameter	Symbol	Values			Unit	Note or Test Condition	Number
		Min.	Typ.	Max.			
Power Supply Current Consumption in Sleep Mode with Loads at $T_J \leq 85$ °C	$I_{VS(SLEEP)\_85}$	–	0.01	0.5	µA	1) V_S = 18 V V_{OUT} = 0 V IN = DEN = “low” $T_J \leq 85$ °C	P_6.5.11.1
Power Supply Current Consumption in Sleep Mode with Loads at T_J = 150 °C	$I_{VS(SLEEP)\_150}$	–	2.5	10	µA	V_S = 18 V V_{OUT} = 0 V IN = DEN = “low” T_J = 150 °C	P_6.5.11.2
Operating Current in Active Mode	$I_{GND(ACTIVE)}$	–	3	4	mA	V_S = 18 V IN = DEN = “high”	P_6.5.11.3
Operating Current in Stand-by Mode	$I_{GND(STBY)}$	–	1.2	1.8	mA	V_S = 18 V IN = “low” DEN = “high”	P_6.5.11.5

1) Not subject to production test - specified by design.

7 Power Stages

The high-side power stage is built using a N-channel vertical Power MOSFET with charge pump.

7.1 Output ON-State Resistance

The ON-state resistance $R_{DS(ON)}$ depends mainly on junction temperature T_J. **Figure 15** shows the variation of $R_{DS(ON)}$ across the whole T_J range. The value “2” on the y-axis corresponds to the maximum $R_{DS(ON)}$ measured at T_J = 150 °C.

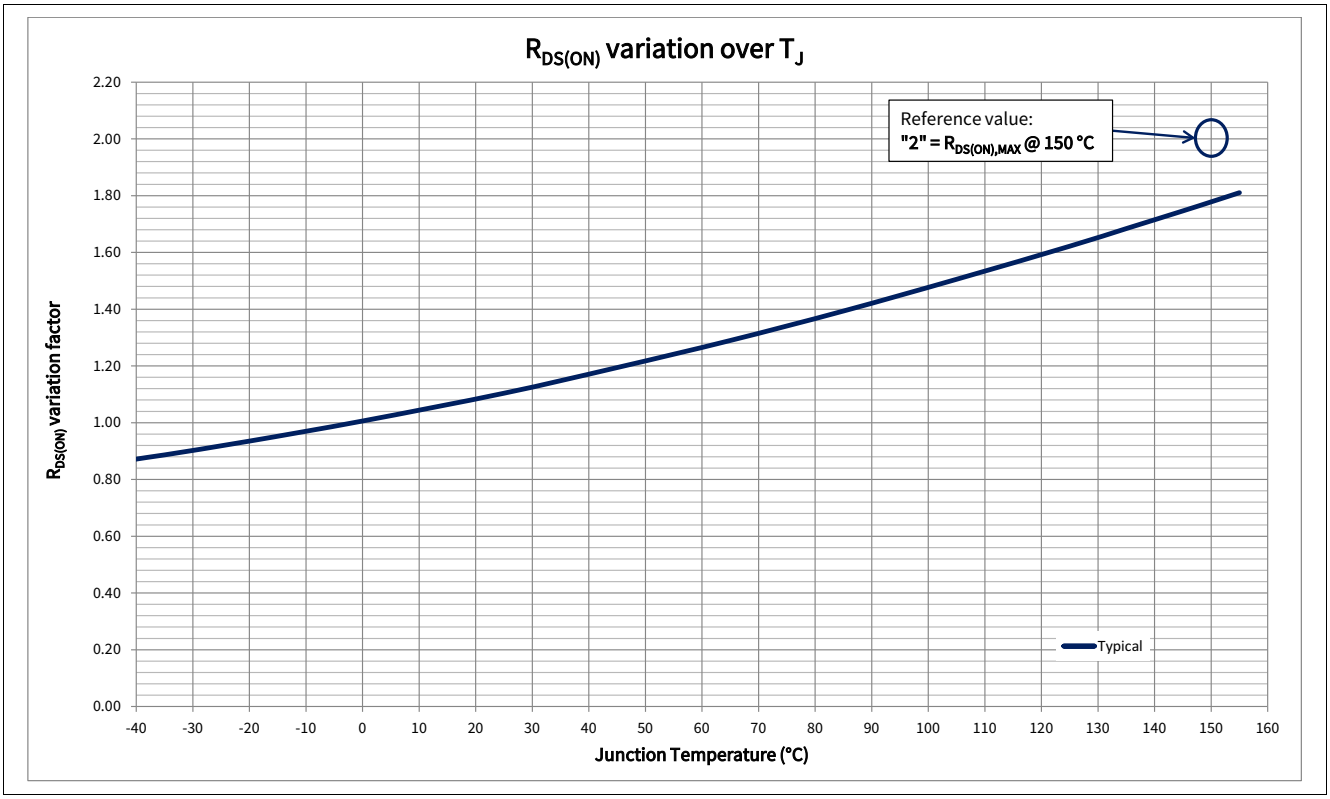

Figure 15 $R_{DS(ON)}$ variation factor

The behavior in Reverse Polarity is described in **Chapter 8.4.1**.

7.2 Switching loads

7.2.1 Switching Resistive Loads

When switching resistive loads, the switching times and slew rates shown in **Figure 16** can be considered. The switch energy values E_{ON} and E_{OFF} are proportional to load resistance and times t_{ON} and t_{OFF}.

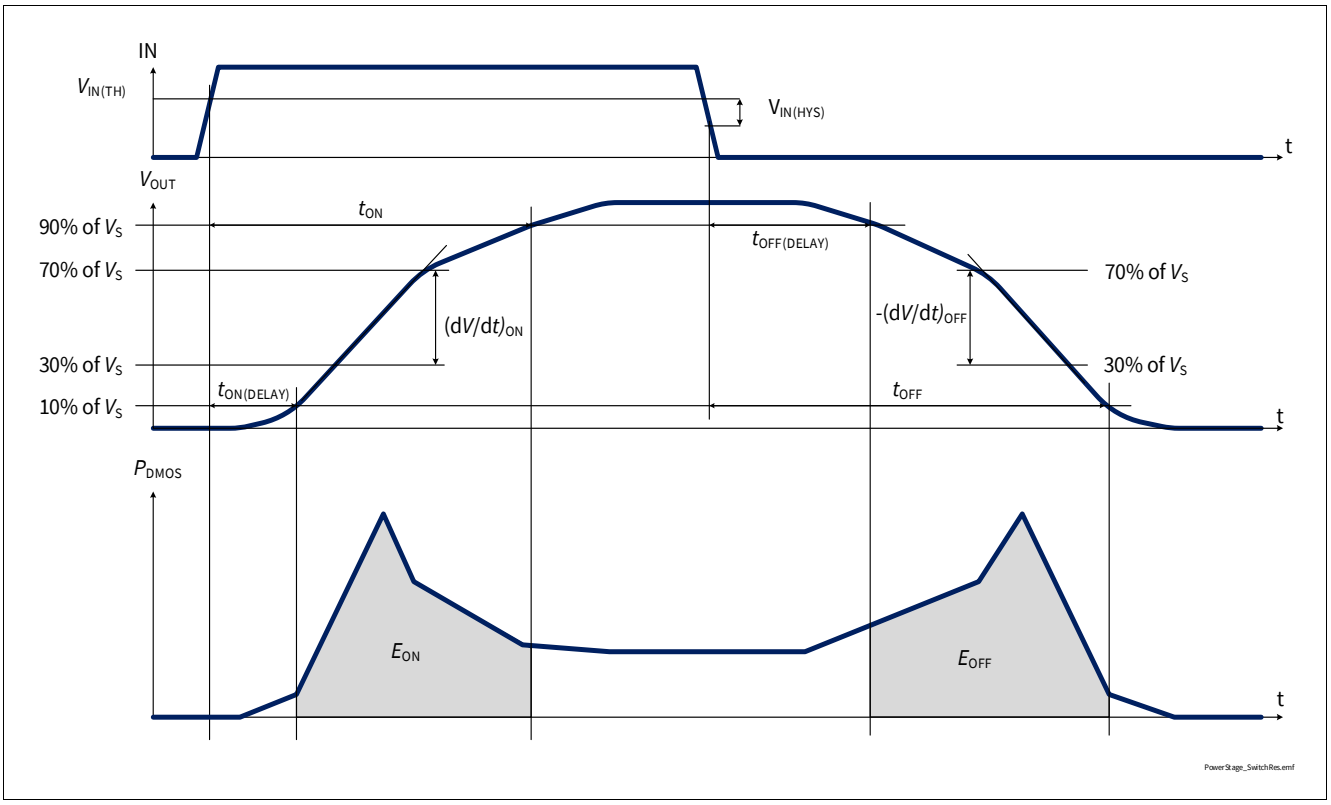

Figure 16 Switching a Resistive Load

7.2.2 Switching Inductive Loads

When switching OFF inductive loads with high-side switches, the voltage V_{OUT} drops below ground potential, because the inductance intends to continue driving the current. To prevent the destruction of the device due to overvoltage, a voltage clamp mechanism is implemented. The clamping structure limits the negative output voltage so that $V_{DS} = V_{DS(CLAMP)}$. **Figure 17** shows a concept drawing of the implementation. The clamping structure protects the device in all operation modes listed in **Chapter 6.1**.

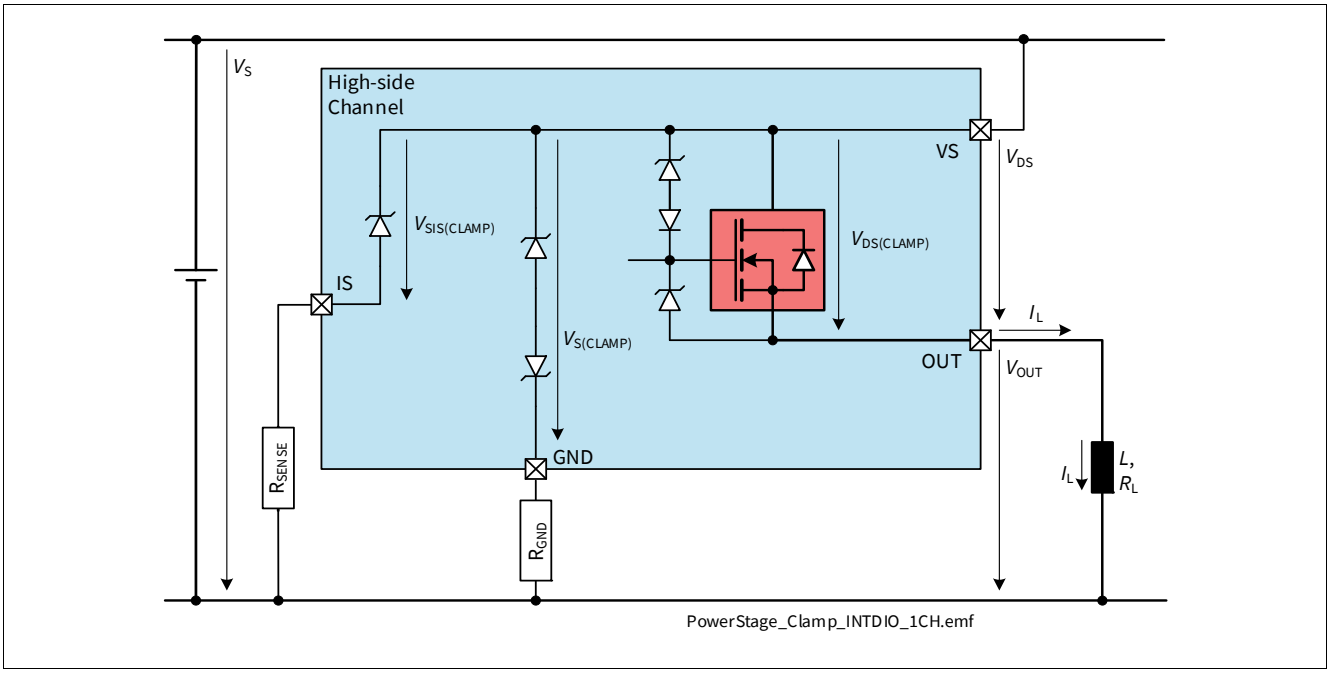

Figure 17 Output Clamp concept

During demagnetization of inductive loads, energy has to be dissipated in BTS7010-1EPA. The energy can be calculated with **Equation (7.1)**:

$$E = V_{DS(CLAMP)} \cdot \left[\frac{V_S - V_{DS(CLAMP)}}{R_L} \cdot \ln\left(1 - \frac{R_L \cdot I_L}{V_S - V_{DS(CLAMP)}}\right) + I_L \right] \cdot \frac{L}{R_L} \quad (7.1)$$

The maximum energy, therefore the maximum inductance for a given current, is limited by the thermal design of the component.

7.2.3 Output Voltage Limitation

To increase the current sense accuracy, V_{DS} voltage is monitored. When the output current I_L decreases while the channel is diagnosed (DEN pin set to “high” - see **Figure 18**) bringing V_{DS} equal or lower than $V_{DS(SLC)}$, the output DMOS gate is partially discharged. This increases the output resistance so that $V_{DS} = V_{DS(SLC)}$ even for very small output currents. The V_{DS} increase allows the current sensing circuitry to work more efficiently, providing better k_{ILIS} accuracy for output current in the low range.

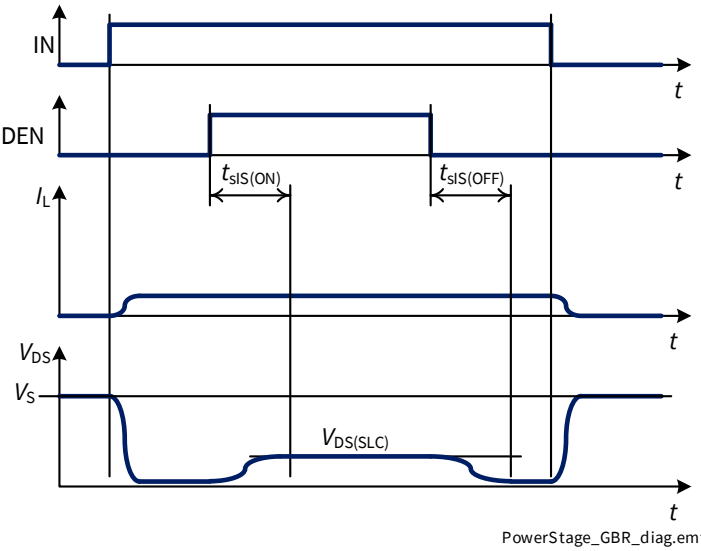

Figure 18 Output Voltage Limitation activation during diagnosis

7.3 Advanced Switching Characteristics

7.3.1 Inverse Current behavior

When $V_{OUT} > V_S$, a current I_{INV} flows into the power output transistor (see **Figure 19**). This condition is known as “Inverse Current”.

If the channel is in OFF state, the current flows through the intrinsic body diode generating high power losses therefore an increase of overall device temperature. If the channel is in ON state, $R_{DS(INV)}$ can be expected and power dissipation in the output stage is comparable to normal operation in $R_{DS(ON)}$.

During Inverse Current condition, the channel remains in ON or OFF state as long as $I_{INV} < I_{L(INV)}$.

With InverseON, it is possible to switch ON the channel during Inverse Current condition as long as $I_{INV} < I_{L(INV)}$ (see **Figure 20**).

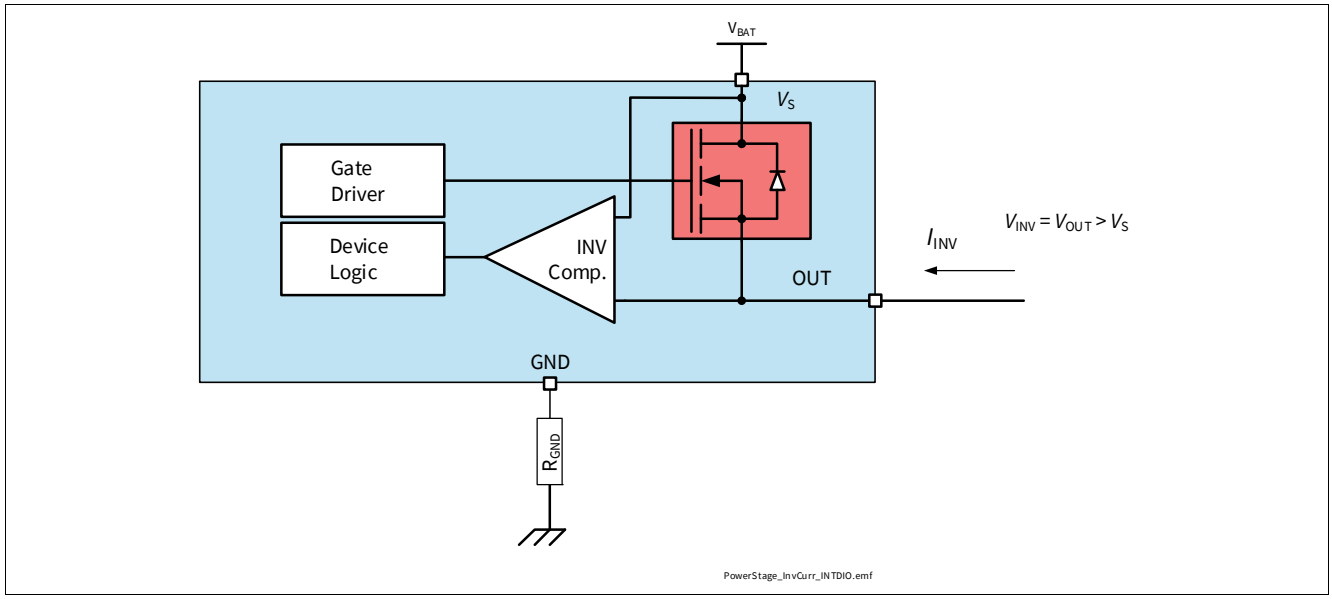

Figure 19 Inverse Current Circuitry

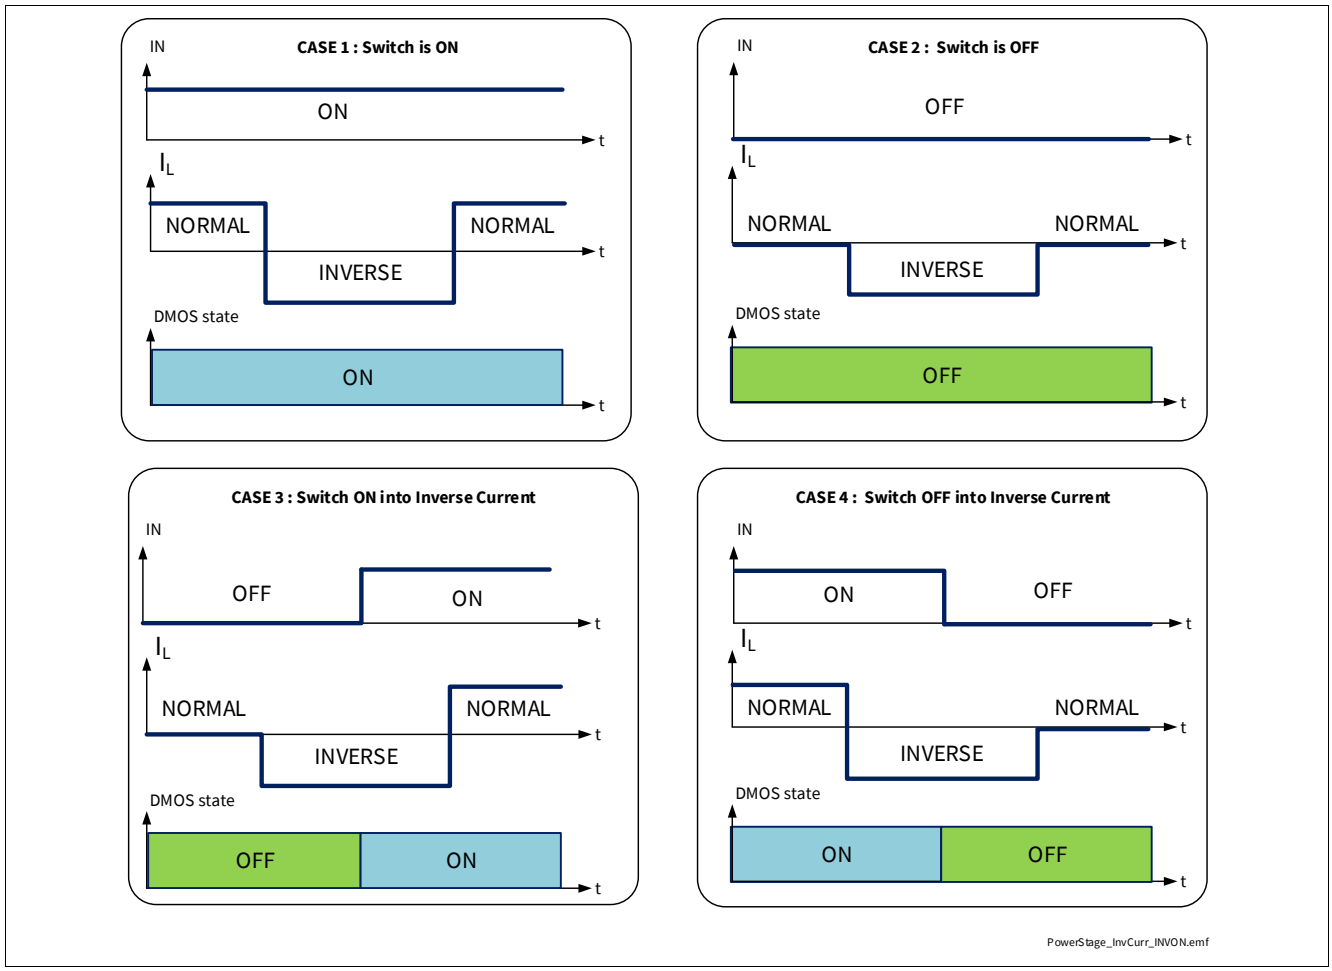

Figure 20 InverseON - Channel behavior in case of applied Inverse Current

Note: No protection mechanism like Overtemperature or Overload protection is active during applied Inverse Currents.

7.3.2 Cross Current robustness with H-Bridge configuration

When BTS7010-1EPA is used as high-side switch e.g. in a bridge configuration (therefore paired with a low-side switch as shown in **Figure 21**), the maximum slew rate applied to the output by the low-side switch must be lower than $|dV_{OUT}/dt|$.

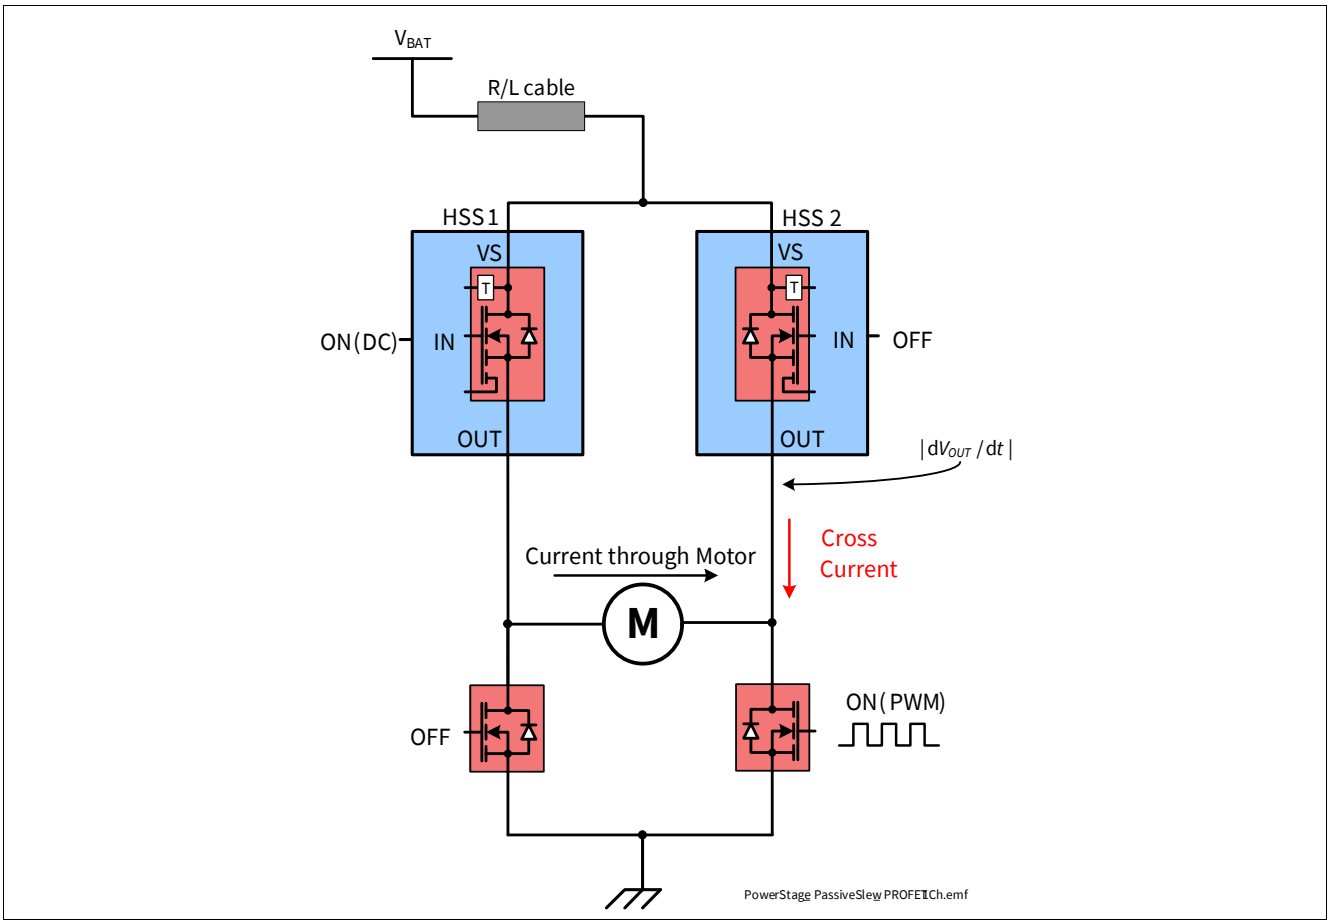

Figure 21 High-Side switch used in Bridge configuration

7.4 Electrical Characteristics Power Stages

V_S = 6 V to 18 V, T_J = -40 °C to +150 °C
Typical values: V_S = 13.5 V, T_J = 25 °C

Typical resistive load connected to the output for testing (unless otherwise specified):

R_L = 3.3 Ω

Table 11 Electrical Characteristics: Power Stages - General

Parameter	Symbol	Values			Unit	Note or Test Condition	Number
		Min.	Typ.	Max.			
Voltages							
Drain to Source Clamping Voltage at T_J = -40 °C	$V_{DS(CLAMP)\_-40}$	33	36.5	42	V	I_L = 5 mA T_J = -40°C See **Figure 17**	P_7.4.0.1

8 Protection

The BTS7010-1EPA is protected against Overtemperature, Overload, Reverse Battery (with ReverseON) and Overvoltage. Overtemperature and Overload protections are working when the device is not in Sleep mode. Overvoltage protection works in all operation modes. Reverse Battery protection works when the GND and VS pins are reverse supplied.

8.1 Overtemperature Protection

The device incorporates both an absolute ($T_{J(ABS)}$) and a dynamic ($T_{J(DYN)}$) temperature protection circuitry for the channel. An increase of junction temperature T_J above either one of the two thresholds ($T_{J(ABS)}$ or $T_{J(DYN)}$) switches OFF the overheated channel to prevent destruction. The channel remains switched OFF until junction temperature has reached the “Restart” condition described in **Table 14**. The behavior is shown in **Figure 22** (absolute Overtemperature Protection) and **Figure 23** (dynamic Overtemperature Protection). $T_{J(REF)}$ is the reference temperature used for dynamic temperature protection.

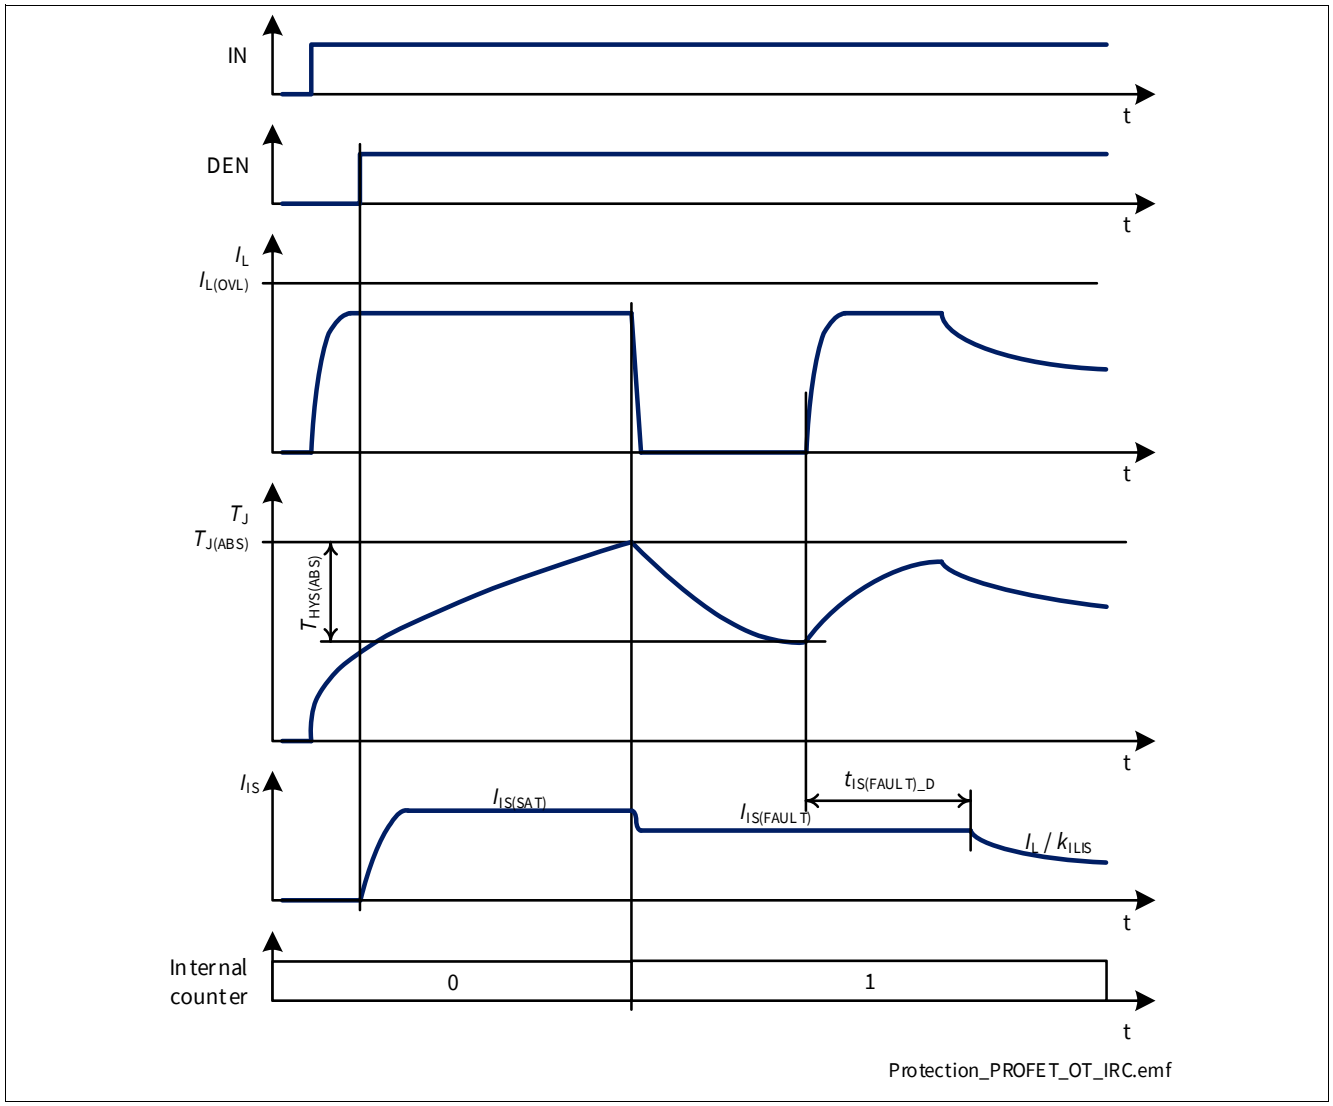

Figure 22 Overtemperature Protection (Absolute)

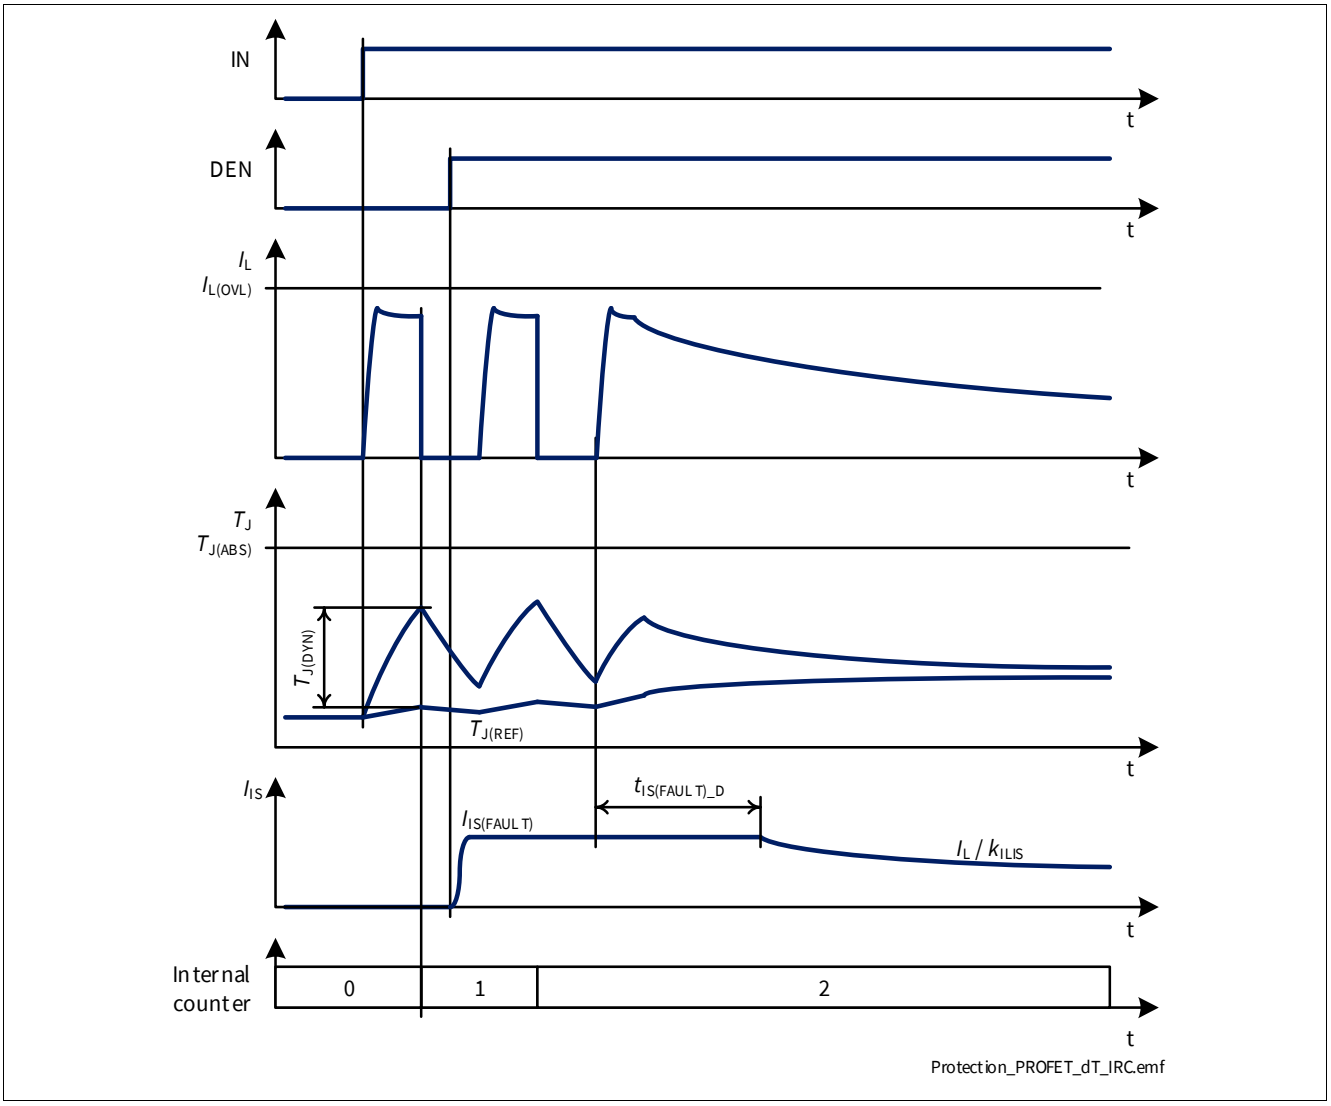

Figure 23 Overtemperature Protection (Dynamic)

When the Overtemperature protection circuitry allows the channel to be switched ON again, the retry strategy described in **Chapter 8.3** is followed.

8.2 Overload Protection

The BTS7010-1EPA is protected in case of Overload or short circuit to ground. Two Overload thresholds are defined (see **Figure 24**) and selected automatically depending on the voltage V_{DS} across the power DMOS:

- $I_{L(OVL0)}$ when V_{DS} < 13 V
- $I_{L(OVL1)}$ when V_{DS} > 22 V

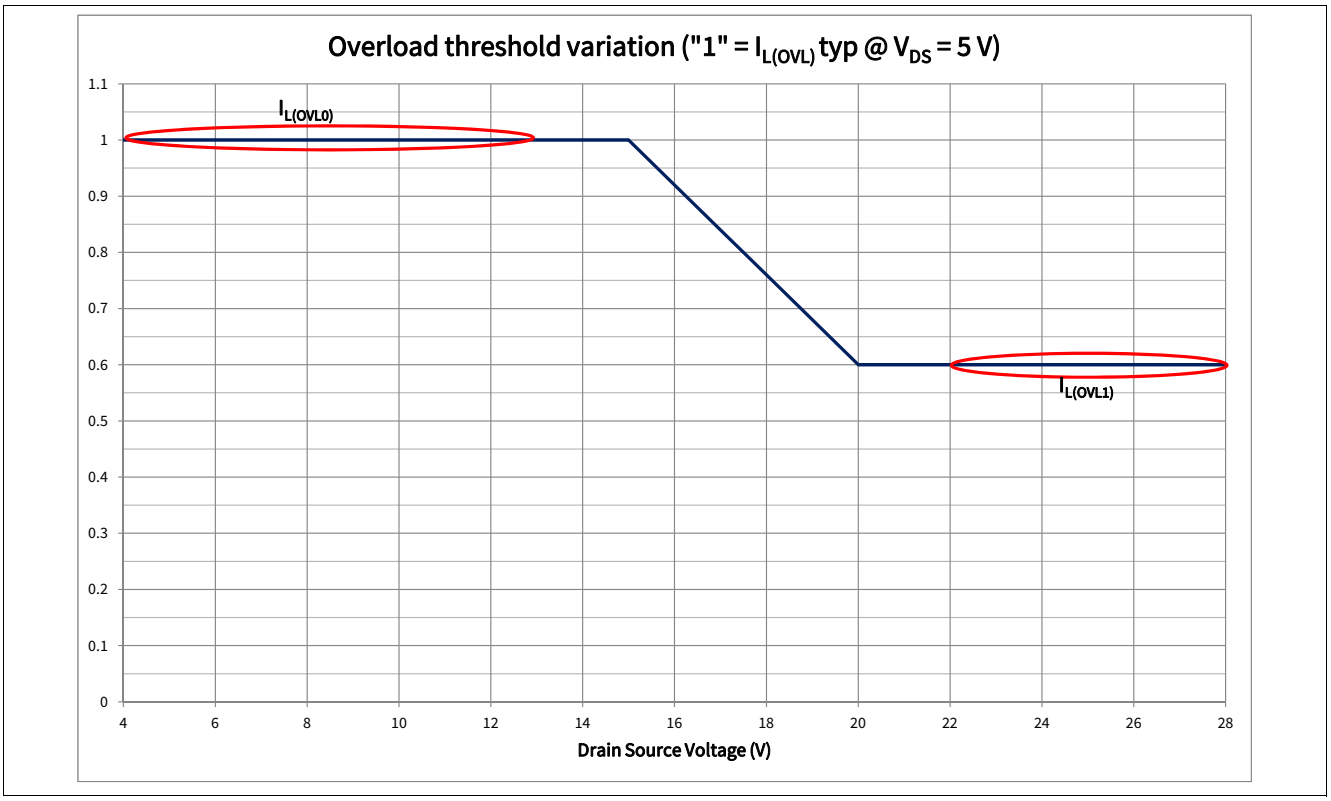

Figure 24 Overload Current Thresholds variation with V_{DS}

In order to allow a higher load inrush at low ambient temperature, Overload threshold is maximum at low temperature and decreases when T_J increases (see **Figure 25**). $I_{L(OVL0)}$ typical value remains approximately constant up to a junction temperature of +75 °C.

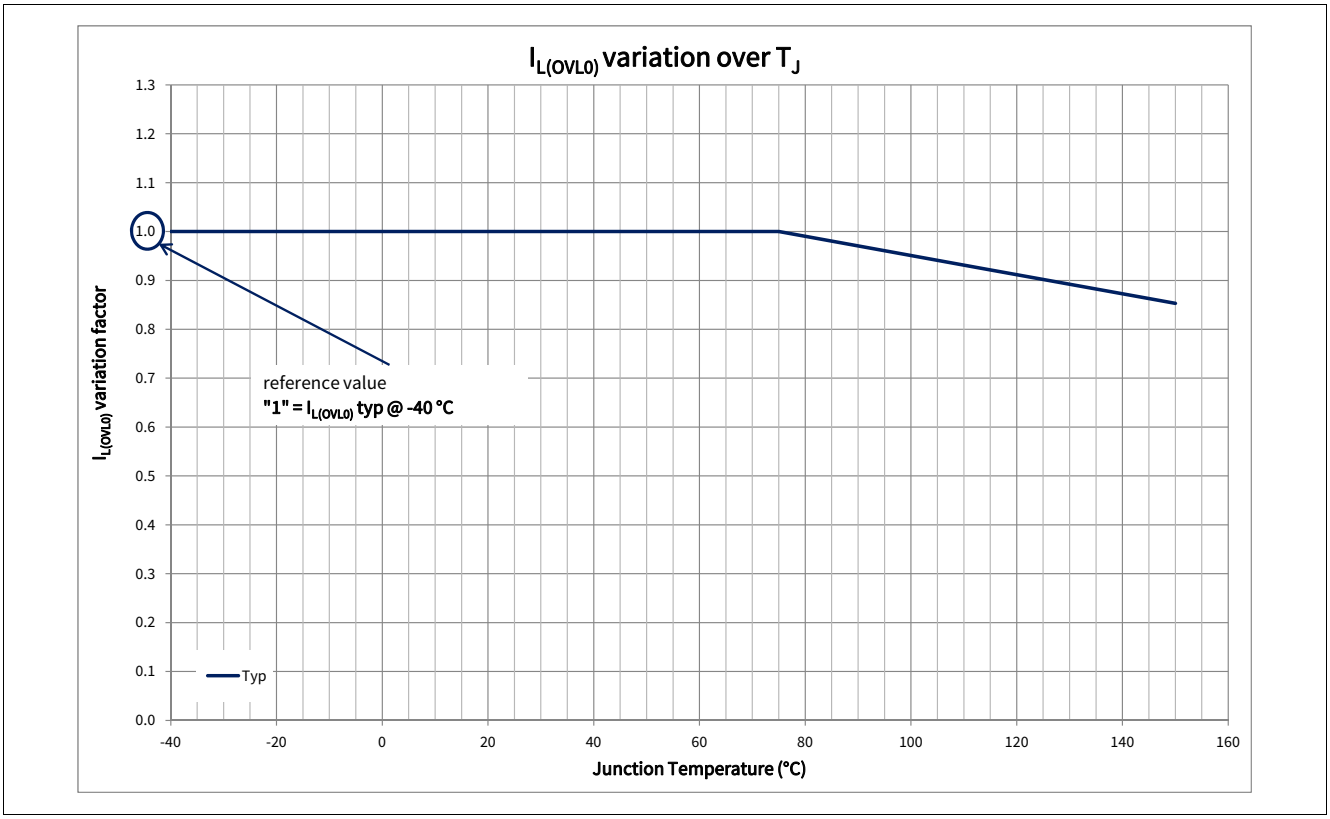

Figure 25 Overload Current Thresholds variation with T_J

Power supply voltage V_S can increase above 18 V for short time, for instance in Load Dump or in Jump Start condition. Whenever $V_S \geq V_{S(JS)}$, the overload detection current is set to $I_{L(OVL\_JS)}$ as shown in **Figure 26**.

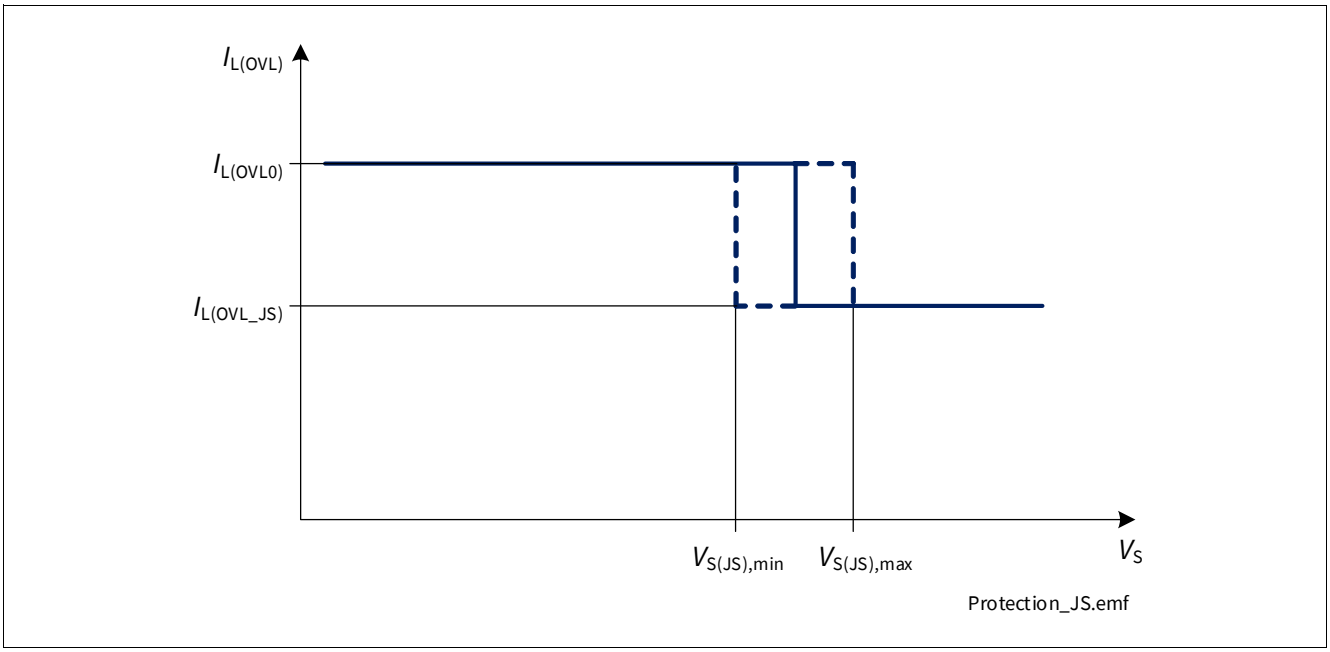

Figure 26 Overload Detection Current variation with V_S voltage

When $I_L \geq I_{L(OVL)}$ (either $I_{L(OVL0)}$, $I_{L(OVL1)}$ or $I_{L(OVL\_JS)}$), the channel is switched OFF. The channel is allowed to restart according to the retry strategy described in **Chapter 8.3**.

8.3 Protection and Diagnosis in case of Fault

Any event that triggers a protection mechanism (either Overtemperature or Overload) has 2 consequences:

- The channel switches OFF and the internal counter is incremented
- If the diagnosis is active for the channel, a current $I_{IS(FAULT)}$ is provided by IS pin (see **Chapter 9.2.2** for further details)

The channel can be switched ON again if all the protection mechanisms fulfill the “restart” conditions described in **Table 14**. Furthermore, the device has an internal retry counter to maximize the robustness in case of fault.

Table 14 Protection “Restart” Condition

Fault condition	Switch OFF event	“Restart” Condition
Overtemperature	$T_J \geq T_{J(ABS)}$ or $(T_J - T_{J(REF)}) \geq T_{J(DYN)}$	$T_J < T_{J(ABS)}$ and $(T_J - T_{J(REF)}) < T_{J(DYN)}$ (including hysteresis)
Overload	$I_L \geq I_{L(OVL)}$	$I_L < 50$ mA T_J within $T_{J(ABS)}$ and $T_{J(DYN)}$ ranges (including hysteresis)

8.3.1 Retry Strategy

When IN is set to “high”, the channel is switched ON. In case of fault condition the output stage is switched OFF. The channel can be allowed to restart only if the “restart” conditions for the protection mechanisms are fulfilled (see **Table 14**).

The channel is allowed to switch ON for $n_{RETRY(CR)}$ times before switching OFF. After a time t_{RETRY}, if the input pin is set to “high”, the channel switches ON again for $n_{RETRY(NT)}$ times before switching OFF again (“retry” cycle). After $n_{RETRY(CYC)}$ consecutive “retry” cycles, the channel latches OFF. It is necessary to set the input pin to “low” for a time longer than $t_{DELAY(CR)}$ to de-latch the channel (“counter reset delay” time) and to reset the internal counter to the default value.

During the “counter reset delay” time, if the input is set to “high” the channel remains switched OFF and the timer counting $t_{DELAY(CR)}$ is reset, starting to count again as soon as the input pin is set to “low” again. If the input pin remains “low” for a time longer than $t_{DELAY(CR)}$ the internal retry counter is reset to the default value, allowing $n_{RETRY(CR)}$ retries at the next channel activation.

The retry strategy is shown in **Figure 29** (flowchart), **Figure 27** (timing diagram - input pin always “high”) and **Figure 28** (timing diagram - channel controlled in PWM).

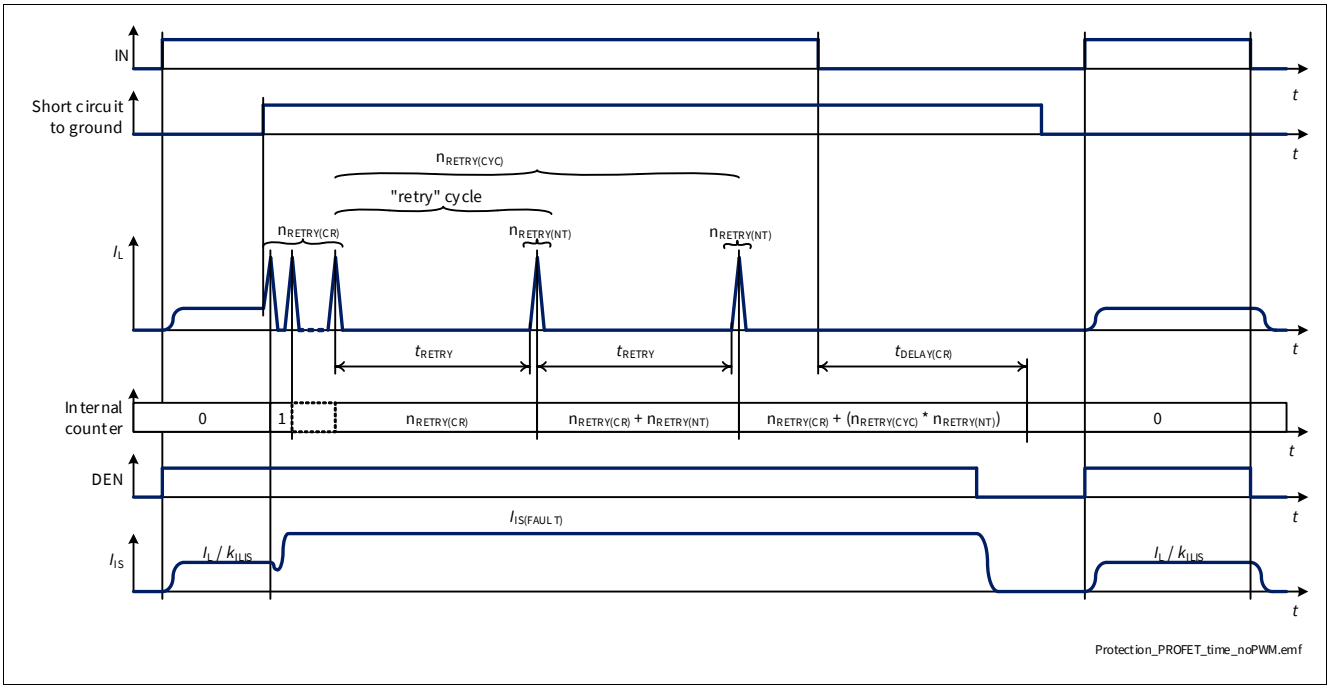

Figure 27 Retry Strategy Timing Diagram

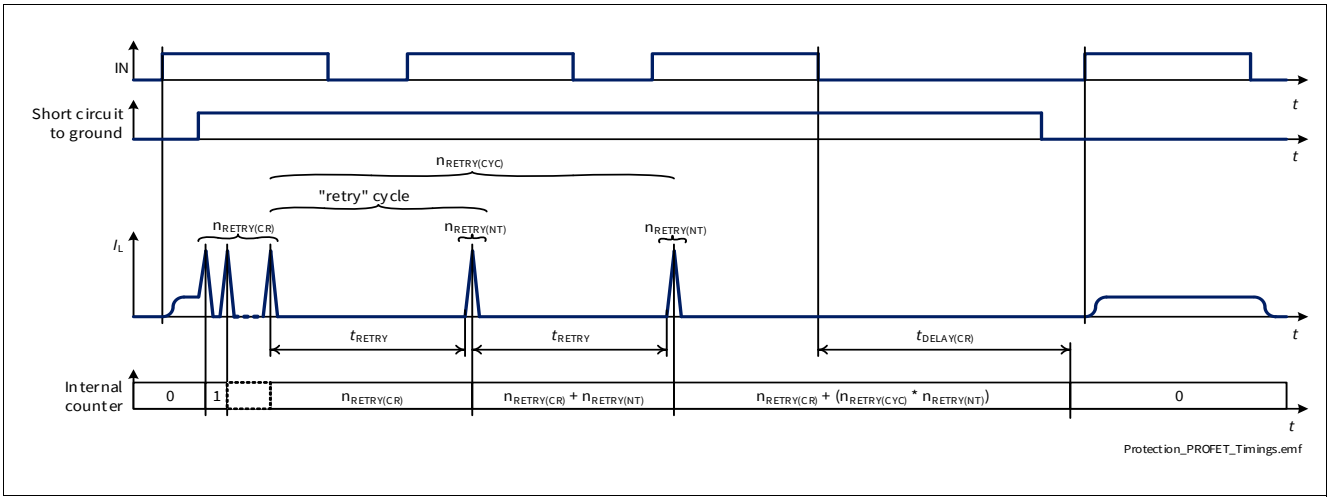

Figure 28 Retry Strategy Timing Diagram - Channel operated in PWM

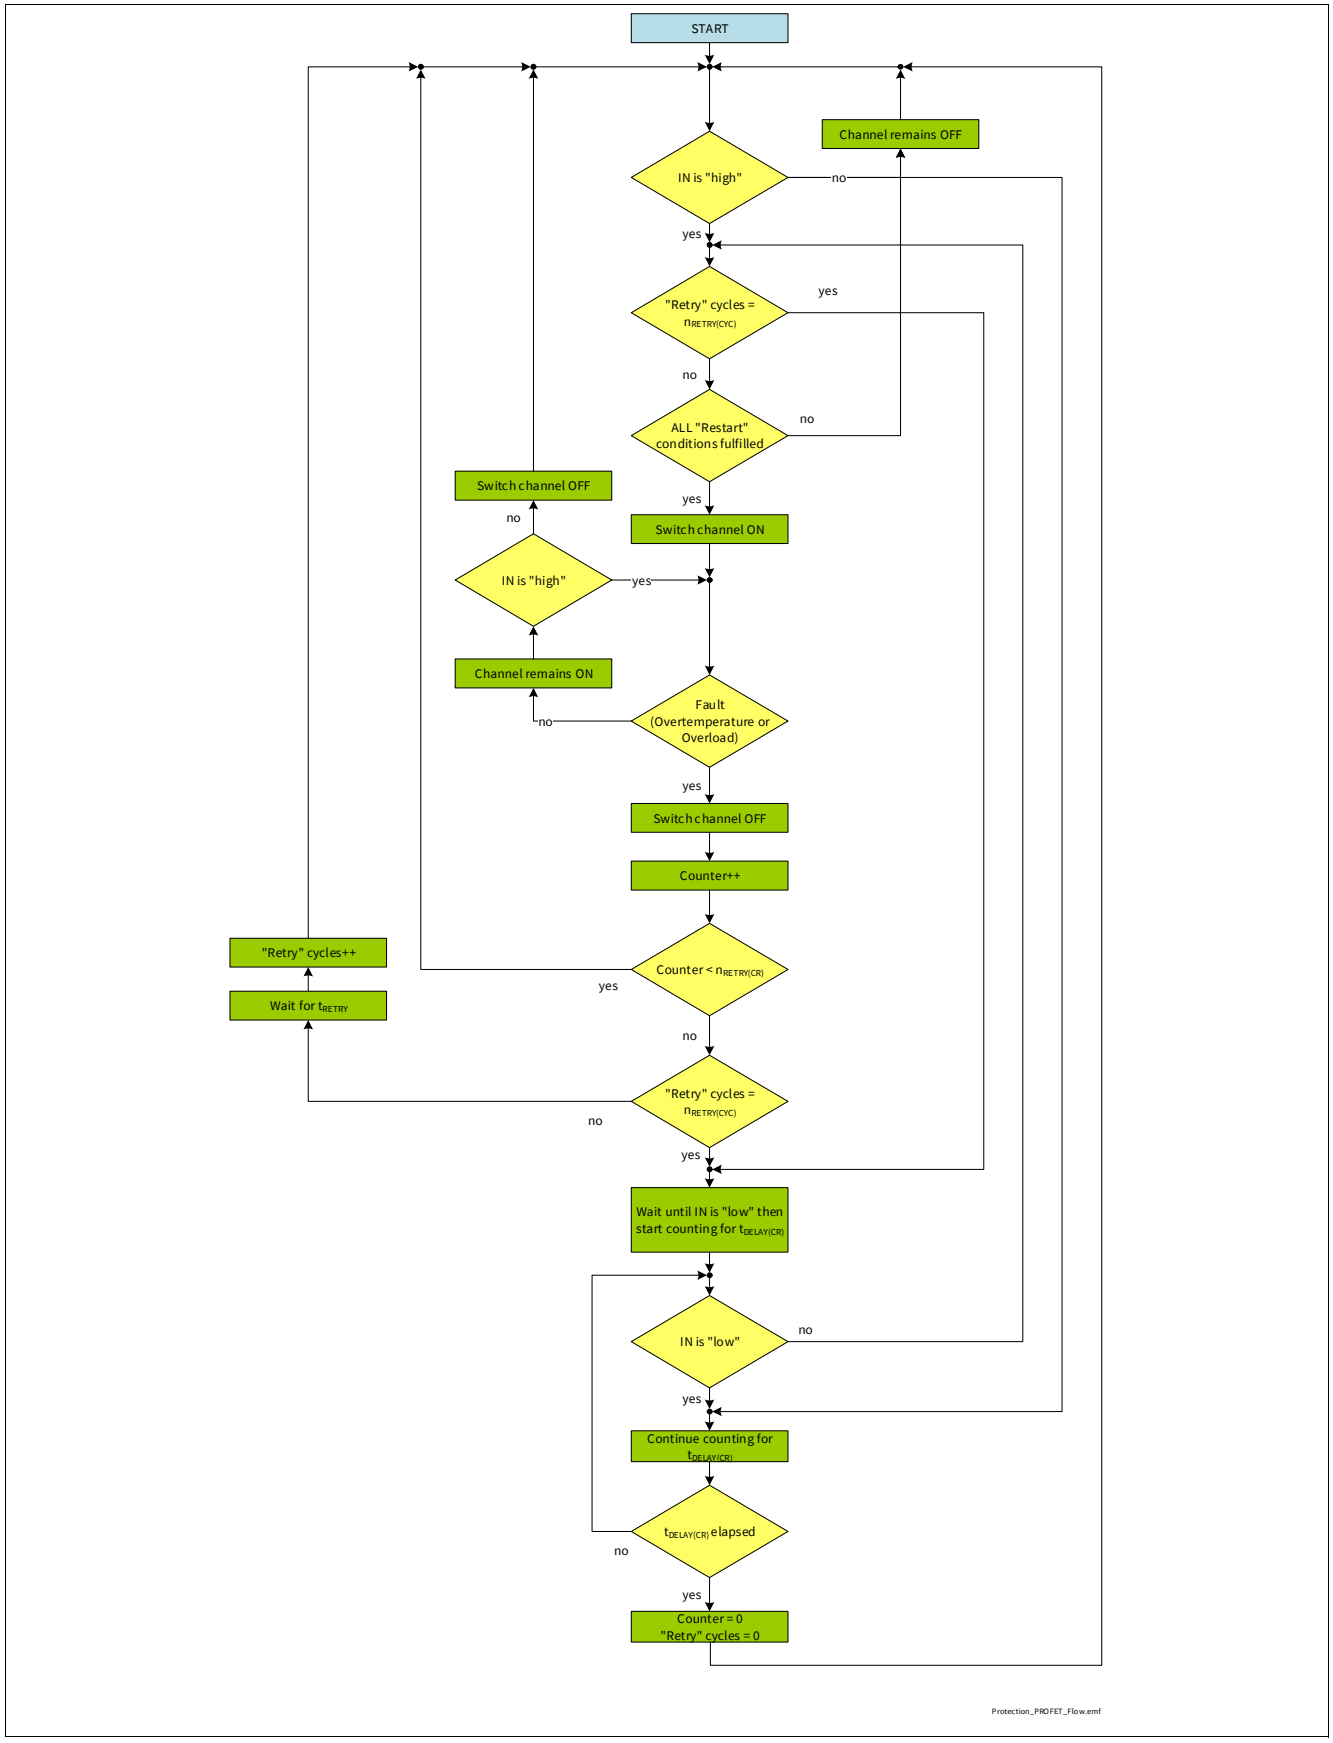

Figure 29 Retry Strategy Flowchart

It is possible to “force” a reset of the internal counter without waiting for $t_{DELAY(CR)}$ by applying a pulse (rising edge followed by a falling edge) to the DEN pin while IN pin is “low”. The pulse applied to DEN pin must have a duration longer than $t_{DEN(CR)}$ to ensure a reset of the internal counter.

The timings are shown in **Figure 30**.

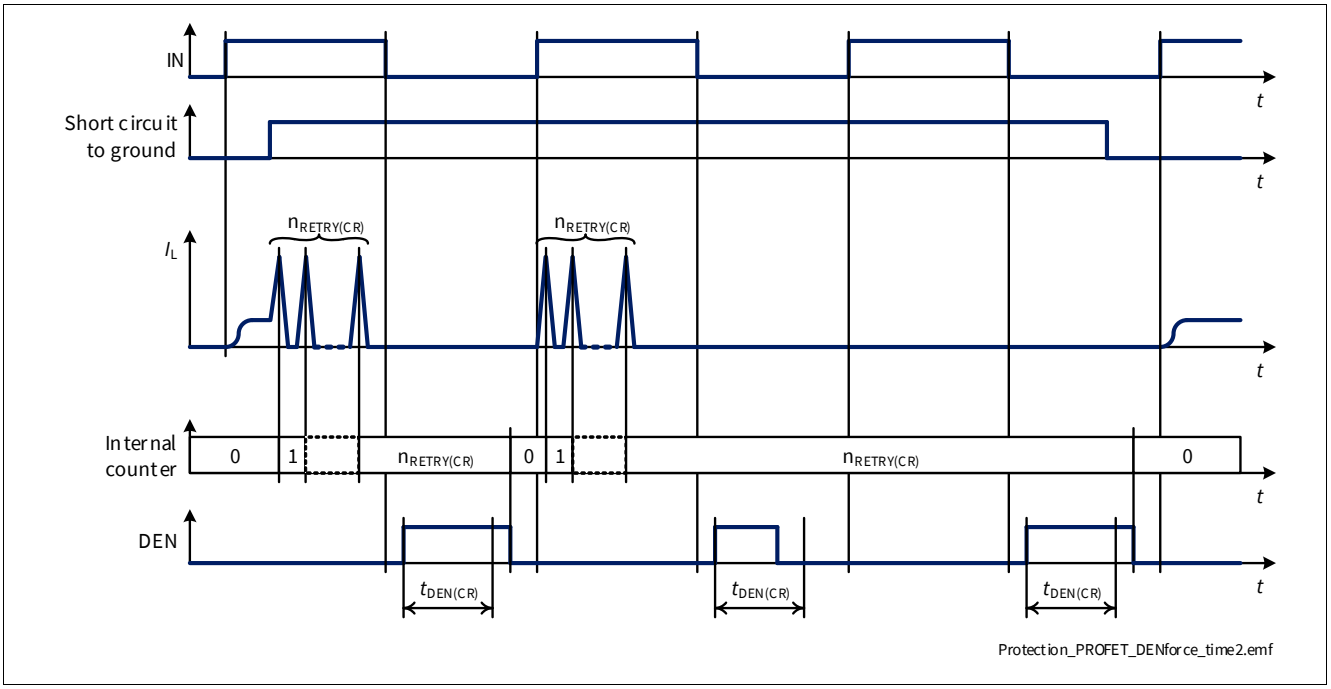

Figure 30 Retry Strategy Timing Diagram with Forced Reset

8.4 Additional protections

8.4.1 Reverse Polarity Protection

In Reverse Polarity condition (also known as Reverse Battery), the output stage is switched ON (see parameter $R_{DS(REV)}$) because of ReverseON feature which limits the power dissipation in the output stage. Each ESD diode of the logic contributes to total power dissipation. The reverse current through the output stage must be limited by the connected load. The current through Digital Input pins has to be limited as well by an external resistor (please refer to the Absolute Maximum Ratings listed in **Chapter 4.1** and to Application Information in **Chapter 10**).

Figure 31 shows a typical application including a device with ReverseON. A current flowing into GND pin ($-I_{GND}$) during Reverse Polarity condition is necessary to activate ReverseON, therefore a resistive path between module ground and device GND pin must be present.

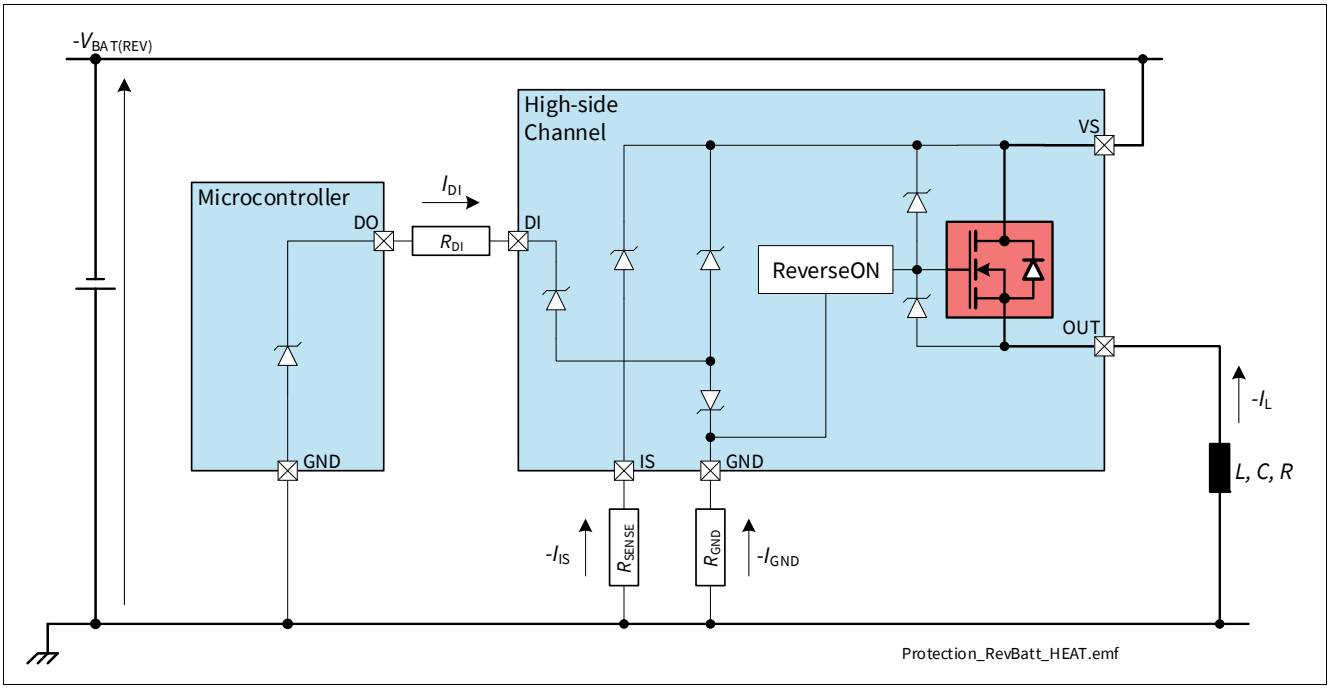

Figure 31 Reverse Battery Protection (application example)

8.4.2 Overvoltage Protection

In the case of supply voltages between $V_{S(EXT,UP)}$ and $V_{BAT(LD)}$, the output transistor is still operational and follows the input pin. In addition to the output clamp for inductive loads as described in **Chapter 7.2.2**, there is a clamp mechanism available for Overvoltage protection for the logic and the output channel, monitoring the voltage between VS and GND pins ($V_{S(CLAMP)}$).

8.5 Protection against loss of connection

8.5.1 Loss of Battery and Loss of Load

The loss of connection to battery or to the load has no influence on device robustness when load and wire harness are purely resistive. In case of driving an inductive load, the energy stored in the inductance must be handled. PROFET™ +2 12V devices can handle the inductivity of the wire harness up to 10 µH with $I_{L(NOM)}$. In case of applications where currents and/or the aforementioned inductivity are exceeded, an external suppressor diode (like diode D_{Z2} shown in **Chapter 10**) is recommended to handle the energy and to provide a well-defined path to the load current.

8.5.2 Loss of Ground

In case of loss of device ground, it is recommended to have a resistor connected between any Digital Input pin and the microcontroller to ensure a channel switch OFF (as described in **Chapter 10**).

Note: In case any Digital Input pin is pulled to ground (either by a resistor or active) a parasitic ground path is available, which could keep the device operational during loss of device ground.

8.6 Electrical Characteristics Protection

V_S = 6 V to 18 V, T_J = -40 °C to +150 °C
Typical values: V_S = 13.5 V, T_J = 25 °C

Typical resistive load connected to the output for testing (unless otherwise specified):

R_L = 3.3 Ω

2) Not subject to production test - specified by design.

9 Diagnosis

For diagnosis purpose, the BTS7010-1EPA provides a combination of digital and analog signals at pin IS. These signals are generically named SENSE and written I_{IS}. In case of disabled diagnostic (DEN pin set to “low”), IS pin becomes high impedance.

A sense resistor R_{SENSE} must be connected between IS pin and module ground if the current sense diagnosis is used. R_{SENSE} value has to be higher than 820 Ω (or 400 Ω when a central Reverse Battery protection is present on the battery feed) to limit the power losses in the sense circuitry. A typical value is R_{SENSE} = 1.2 kΩ.

Due to the internal connection between IS pin and V_S supply voltage, it is not recommended to connect the IS pin to the sense current output of other devices, if they are supplied by a different battery feed.

See **Figure 32** for details as an overview.

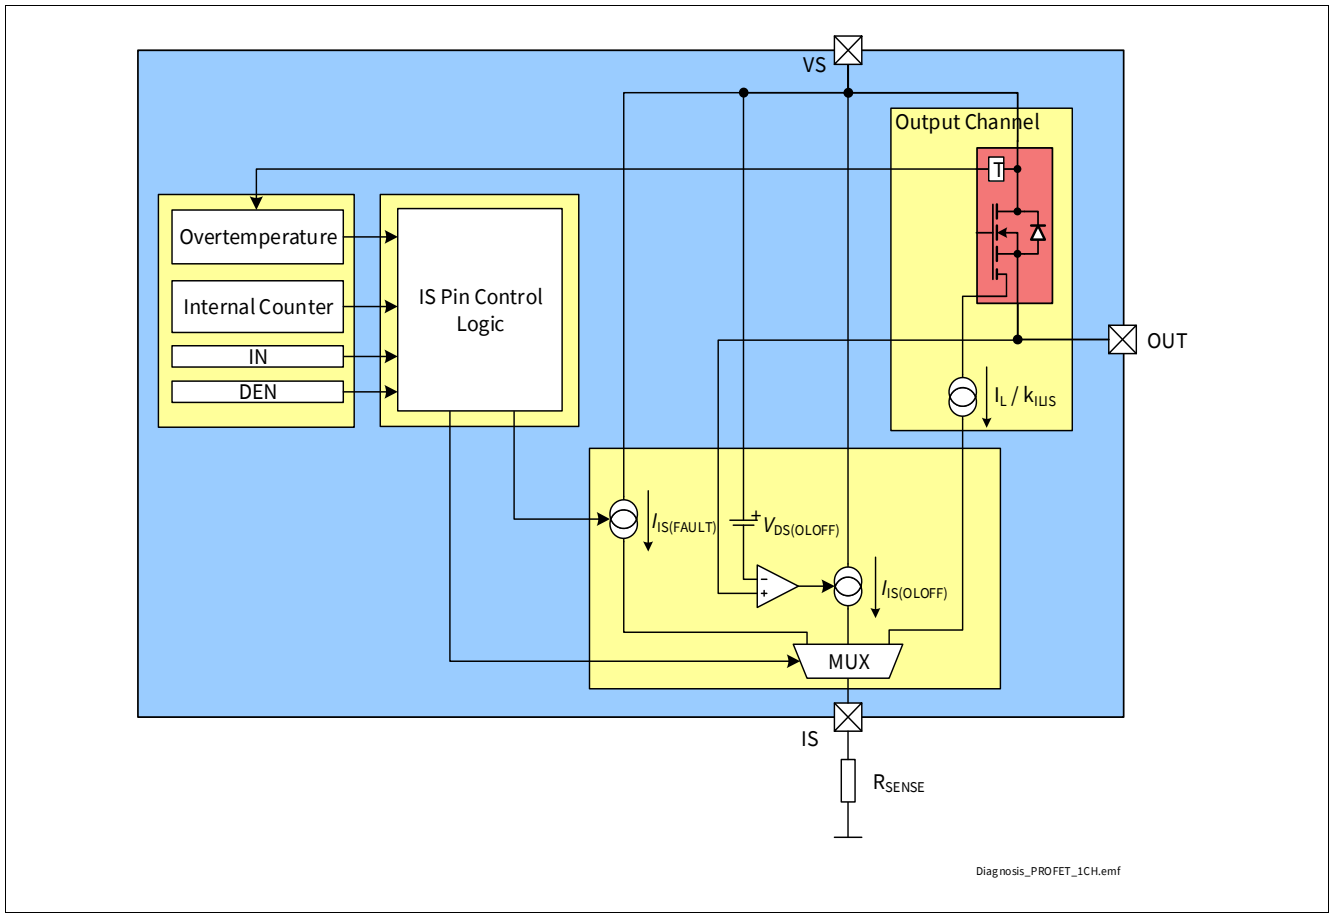

Figure 32 Diagnosis Block Diagram

9.1 Overview

Table 18 gives a quick reference to the state of the IS pin during BTS7010-1EPA operation.

Table 18 SENSE Signal, Function of Application Condition

Application Condition	Input level	DEN level	V_{OUT}	Diagnostic Output
Normal operation	"low"	"high"	~ GND	Z $I_{IS(FAULT)}$ if counter > 0
Short circuit to GND			~ GND	Z $I_{IS(FAULT)}$ if counter > 0
Overtemperature			Z	$I_{IS(FAULT)}$
Short circuit to V_S			V_S	$I_{IS(OLOFF)}$ ($I_{IS(FAULT)}$ if counter > 0)
Open Load			< V_S - $V_{DS(OLOFF)}$ > V_S - $V_{DS(OLOFF)}$ [1]	Z $I_{IS(OLOFF)}$ (in both cases $I_{IS(FAULT)}$ if counter > 0)
Inverse current			~ V_{INV} = V_{OUT} > V_S	$I_{IS(OLOFF)}$ ($I_{IS(FAULT)}$ if counter > 0)
Normal operation	"high"		~ V_S	I_{IS} = I_L / k_{ILIS}
Overcurrent			< V_S	$I_{IS(FAULT)}$
Short circuit to GND			~ GND	$I_{IS(FAULT)}$
Overtemperature			Z	$I_{IS(FAULT)}$
Short circuit to V_S			V_S	I_{IS} < I_L / k_{ILIS}
Open Load			~ V_S [2]	I_{IS} = $I_{IS(EN)}$
Under load (e.g. Output Voltage Limitation condition)			~ V_S [3]	$I_{IS(EN)}$ < I_{IS} < $I_{L(NOM)}$ / k_{ILIS}
Inverse current			~ V_{INV} = V_{OUT} > V_S	I_{IS} = $I_{IS(EN)}$
All conditions	n.a.	"low"	n.a.	Z

1) With additional pull-up resistor.
2) The output current has to be smaller than $I_{L(OL)}$.
3) The output current has to be higher than $I_{L(OL)}$.

9.2 Diagnosis in ON state

A current proportional to the load current (ratio $k_{ILIS} = I_L / I_{IS}$) is provided at pin IS when the following conditions are fulfilled:

- The power output stage is switched ON with $V_{DS} < V_{DS(OLOFF)}$
- The diagnosis is enabled
- No fault (as described in **Chapter 8.3**) is present or was present and not cleared yet (see **Chapter 9.2.2** for further details)

If a "hard" failure mode is present or was present and not cleared yet a current $I_{IS(FAULT)}$ is provided at IS pin.

9.2.1 Current Sense (k_{ILIS})

The accuracy of the sense current depends on temperature and load current. I_{IS} increases linearly with I_L output current until it reaches the saturation current $I_{IS(SAT)}$. In case of Open Load at the output stage (I_L close to 0 A), the maximum sense current $I_{IS(EN)}$ (no load, diagnosis enabled) is specified. This condition is shown in **Figure 34**. The blue line represents the ideal k_{ILIS} line, while the red lines show the behavior of a typical product.

An external RC filter between IS pin and microcontroller ADC input pin is recommended to reduce signal ripple and oscillations (a minimum time constant of 1 µs for the RC filter is recommended).

The k_{ILIS} factor is specified with limits that take into account effects due to temperature, supply voltage and manufacturing process. Tighter limits are possible (within a defined current window) with calibration:

- A well-defined and precise current ($I_{L(CAL)}$) is applied at the output during End of Line test at customer side
- The corresponding current at IS pin is measured and the k_{ILIS} is calculated (k_{ILIS} @ $I_{L(CAL)}$)
- Within the current range going from $I_{L(CAL)\_L}$ to $I_{L(CAL)\_H}$ the k_{ILIS} is equal to k_{ILIS} @ $I_{L(CAL)}$ with limits defined by Δk_{ILIS}

The derating of k_{ILIS} after calibration is calculated using the formulas in **Figure 33** and it is specified by Δk_{ILIS}

$$\Delta k_{ILIS,MAX} = 100 \cdot MAX\left(\frac{k_{ILIS}@I_{L(CAL)\_L}}{k_{ILIS}@I_{L(CAL)}} - 1, \frac{k_{ILIS}@I_{L(CAL)\_H}}{k_{ILIS}@I_{L(CAL)}} - 1\right)$$

$$\Delta k_{ILIS,MIN} = 100 \cdot MIN\left(\frac{k_{ILIS}@I_{L(CAL)\_L}}{k_{ILIS}@I_{L(CAL)}} - 1, \frac{k_{ILIS}@I_{L(CAL)\_H}}{k_{ILIS}@I_{L(CAL)}} - 1\right)$$

Figure 33 Δk_{ILIS} calculation formulas

The calibration is intended to be performed at $T_{A(CAL)}$ = 25°C. The parameter Δk_{ILIS} includes the drift overtemperature as well as the drift over the current range from $I_{L(CAL)\_L}$ to $I_{L(CAL)\_H}$.

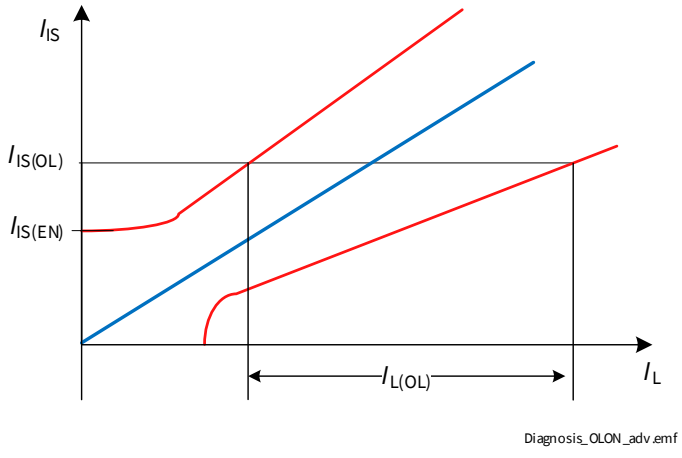

Figure 34 Current Sense Ratio in Open Load at ON condition

9.2.2 Fault Current ($I_{IS(FAULT)}$)

As soon a protection event occurs, changing the value of the internal retry counter (see **Chapter 8.3** for more details) from its reset state, a current $I_{IS(FAULT)}$ is provided by pin IS when DEN is set to “high”. The following 3 situations may occur:

- If the channel is ON and the number of retries is lower than “$n_{RETRY(CR)} + n_{RETRY(CYC)} * n_{RETRY(NT)}$”, the current $I_{IS(FAULT)}$ is provided for a time $t_{IS(FAULT)\_D}$ after the channel is allowed to restart, after which $I_{IS} = I_L / k_{ILIS}$ (as shown in **Figure 35**). During a retry cycle (while timer t_{RETRY} is running) the current $I_{IS(FAULT)}$ is provided each time the channel diagnosis is checked
- If the channel is ON and the number of retries is equal than “$n_{RETRY(CR)} + n_{RETRY(CYC)} * n_{RETRY(NT)}$”, the current $I_{IS(FAULT)}$ is provided until the internal counter is reset (either by expiring of $t_{DELAY(CR)}$ time or by DEN pin pulse, as described in **Chapter 8.3.1**)
- If the channel is OFF and the internal counter is not in the reset state, the current $I_{IS(FAULT)}$ is provided each time the channel diagnosis is checked

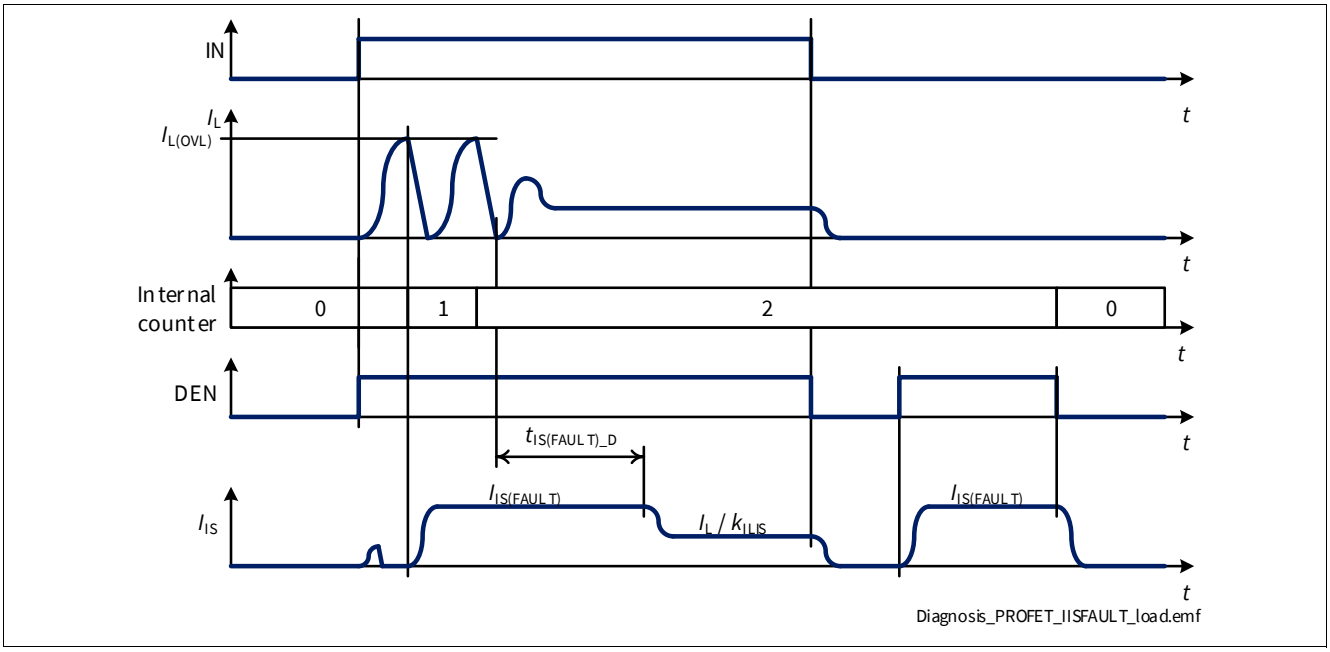

Figure 35 $I_{IS(FAULT)}$ at Load Switching

Figure 36 adds the behavior of SENSE signal to the timing diagram seen in **Figure 28**, while **Figure 37** shows the relation between $I_{IS} = I_L / k_{ILIS}$, $I_{IS(SAT)}$ and $I_{IS(FAULT)}$.

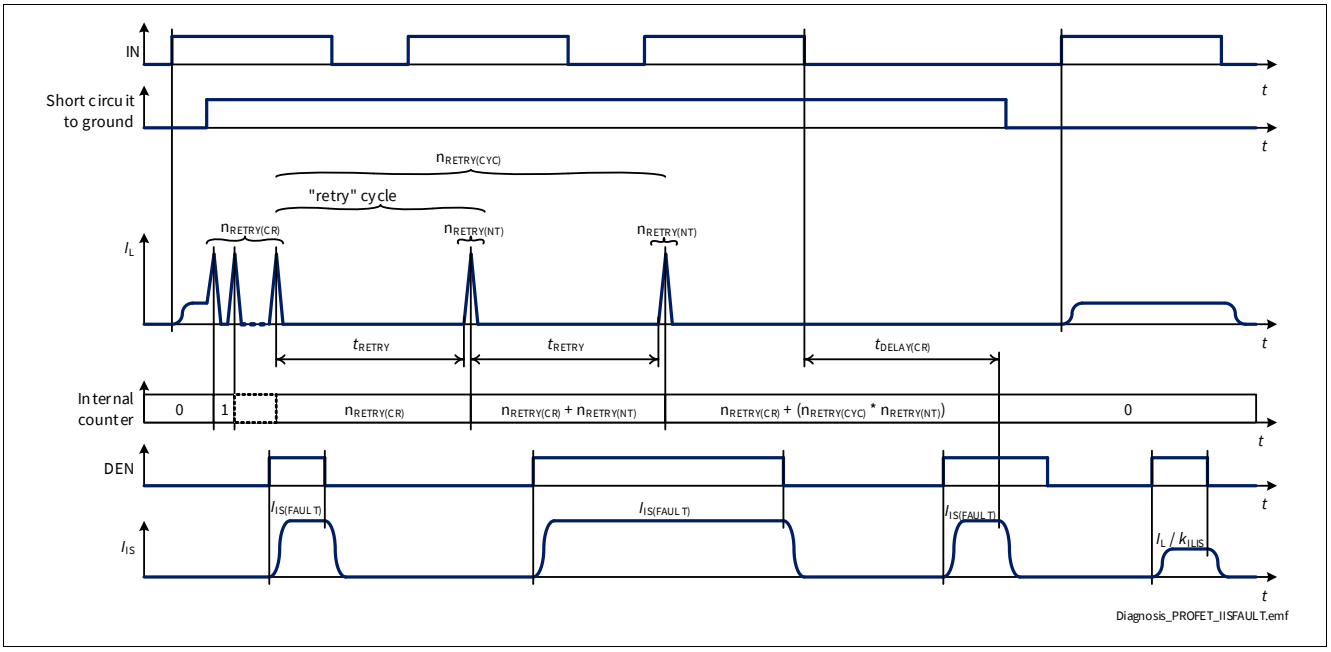

Figure 36 SENSE behavior in Fault condition

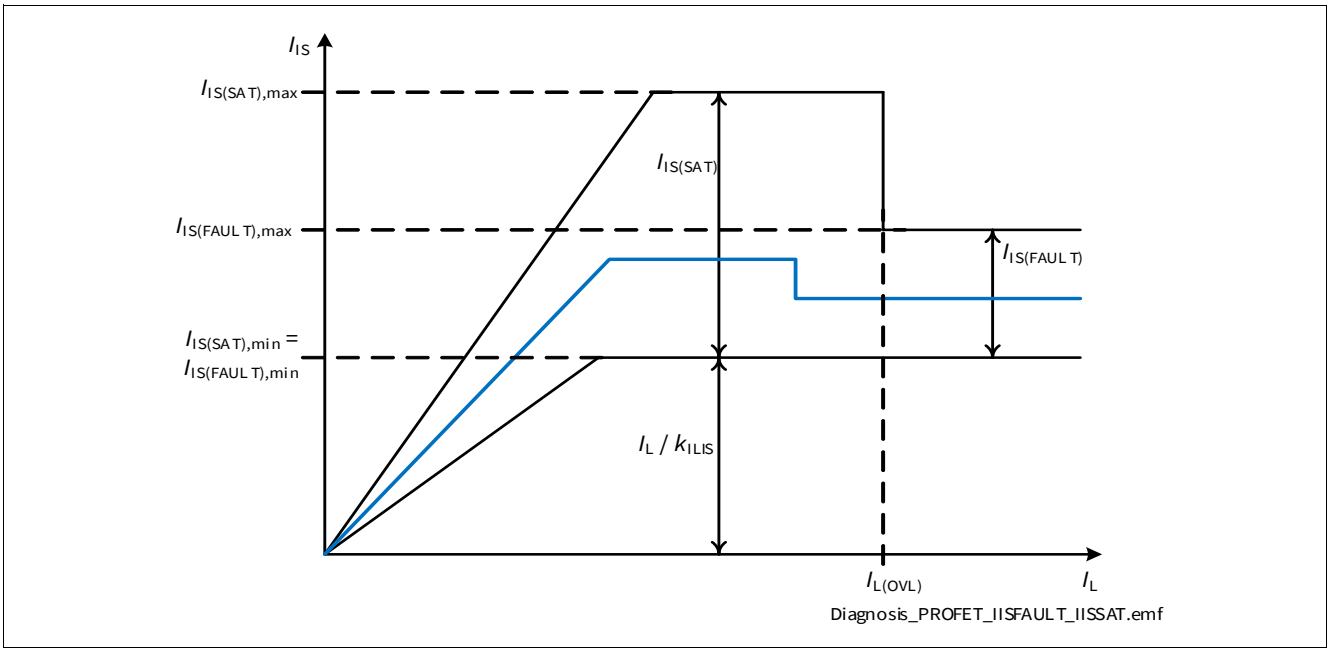

Figure 37 SENSE behavior - overview

9.3 Diagnosis in OFF state

When a power output stage is in OFF state, the BTS7010-1EPA can measure the output voltage and compare it with a threshold voltage. In this way, using some additional external components (a pull-down resistor and a switchable pull-up current source), it is possible to detect if the load is missing or if there is a short circuit to battery. If a Fault condition was detected by the device (the internal counter has a value different from the reset value, as described in **Chapter 9.2.2**) a current $I_{IS(FAULT)}$ is provided by IS pin each time the channel diagnosis is checked also in OFF state.

9.3.1 Open Load current ($I_{IS(OLOFF)}$)

In OFF state, when DEN pin is set to “high”, the V_{DS} voltage is compared with a threshold voltage $V_{DS(OLOFF)}$. If the load is properly connected and there is no short circuit to battery, V_{DS} ~ V_S therefore V_{DS} > $V_{DS(OLOFF)}$. When the diagnosis is active and V_{DS} ≤ $V_{DS(OLOFF)}$, a current $I_{IS(OLOFF)}$ is provided by IS pin. **Figure 38** shows the relationship between $I_{IS(OLOFF)}$ and $I_{IS(FAULT)}$ as functions of V_{DS}. The two currents do not overlap making it always possible to differentiate between Open Load in OFF and Fault condition.

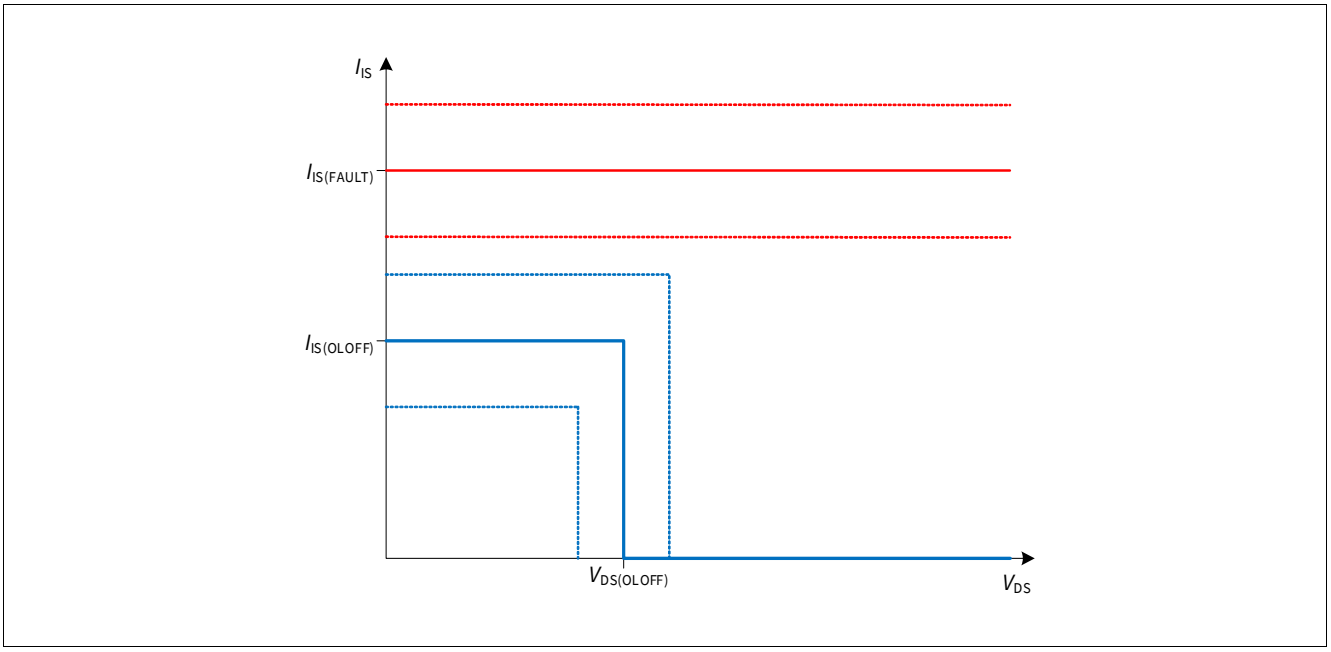

Figure 38 I_{IS} in OFF State

It is necessary to wait a time $t_{IS(OLOFF)\_D}$ between the falling edge of the input pin and the sensing at pin IS for Open Load in OFF diagnosis to allow the internal comparator to settle. In **Figure 39** the timings for an Open Load detection are shown - the load is always disconnected.

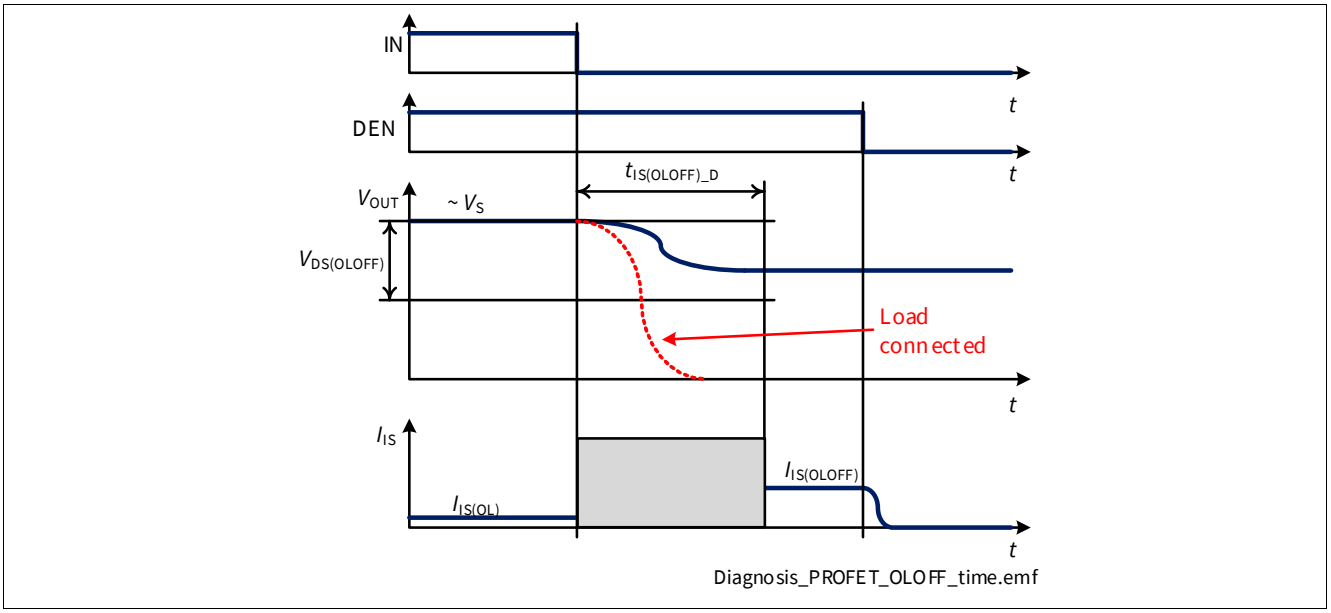

Figure 39 Open Load in OFF Timings - load disconnected

9.4 SENSE Timings

Figure 40 shows the timing during settling $t_{sIS(ON)}$ and disabling $t_{sIS(OFF)}$ of the SENSE (including the case of load change). As a proper signal cannot be established before the load current is stable (therefore before t_{ON}), $t_{sIS(DIAG)} = t_{sIS(ON)} + t_{ON}$.

		Min.	Typ.	Max.			
SENSE Saturation Current	$I_{IS(SAT)}$	4.4	–	15	mA	1) V_S = 8 V to 18 V R_{SENSE} = 1.2 kΩ See **Figure 37**	P_9.6.0.13
SENSE Saturation Current	$I_{IS(SAT)}$	4.1	–	15	mA	1) V_S = 6 V to 18 V R_{SENSE} = 1.2 kΩ See **Figure 37**	P_9.6.0.14
SENSE Leakage Current when Disabled	$I_{IS(OFF)}$	–	0.01	0.5	µA	DEN = “low” $I_L \geq I_{L(NOM)}$ V_{IS} = 0 V	P_9.6.0.2
SENSE Leakage Current when Enabled at $T_J \leq$ 85 °C	$I_{IS(EN)\_85}$	–	0.2	1	µA	1) $T_J \leq$ 85 °C DEN = “high” I_L = 0 A See **Figure 34**	P_9.6.0.3
SENSE Leakage Current when Enabled at T_J = 150 °C	$I_{IS(EN)\_150}$	–	0.2	1	µA	T_J = 150 °C DEN = “high” I_L = 0 A See **Figure 34**	P_9.6.0.4
Saturation Voltage in k_{ILIS} Operation (V_S - V_{IS})	V_{SIS_k}	–	0.5	1	V	1) V_S = 6 V IN = DEN = “high” $I_L \leq 1.2 * I_{L(NOM)}$	P_9.6.0.6
Saturation Voltage in Open Load at OFF Diagnosis (V_S - V_{IS})	V_{SIS_OL}	–	0.5	1	V	1) V_S = 6 V IN = “low” DEN = “high”	P_9.6.0.7
Saturation Voltage in Fault Diagnosis (V_S - V_{IS})	V_{SIS_F}	–	0.5	1	V	1) V_S = 6 V IN = “low” DEN = “high” counter >0	P_9.6.0.8

Table 19 Electrical Characteristics: Diagnosis - General (continued)

Parameter	Symbol	Values			Unit	Note or Test Condition	Number
		Min.	Typ.	Max.			
Power Supply to IS Pin Clamping Voltage at T_J = -40 °C	$V_{SIS(CLAMP)\_-40}$	33	36.5	42	V	I_{IS} = 1 mA T_J = -40 °C See **Figure 17**	P_9.6.0.9
Power Supply to IS Pin Clamping Voltage at $T_J \geq$ 25 °C	$V_{SIS(CLAMP)\_25}$	35	38	44	V	2) I_{IS} = 1 mA $T_J \geq$ 25 °C See **Figure 17**	P_9.6.0.10

1) Not subject to production test - specified by design.
2) Tested at T_J = 150°C.

9.5.1 Electrical Characteristics Diagnosis - PROFET™

Table 20 Electrical Characteristics: Diagnosis - PROFET™

Parameter	Symbol	Values			Unit	Note or Test Condition	Number
		Min.	Typ.	Max.			
SENSE Fault Current	$I_{IS(FAULT)}$	4.4	5.5	10	mA	See **Figure 37** and **Figure 38**	P_9.6.1.1
SENSE Open Load in OFF Current	$I_{IS(OLOFF)}$	1.9	2.5	3.5	mA	See **Figure 37** and **Figure 38**	P_9.6.1.2
SENSE Delay Time at Channel Switch ON after Last Fault Condition	$t_{IS(FAULT)\_D}$	–	500	–	µs	1) See **Figure 35**	P_9.6.1.3
SENSE Open Load in OFF Delay Time	$t_{IS(OLOFF)\_D}$	30	70	120	µs	$V_{DS} < V_{OL(OFF)}$ from IN falling edge to I_{IS} = $I_{S(OLOFF),MIN}$ * 0.9 DEN = “high” counter = 0 See **Figure 39**	P_9.6.1.4
Open Load V_{DS} Detection Threshold in OFF State	$V_{DS(OLOFF)}$	1.3	1.8	2.3	V	See **Figure 38**	P_9.6.1.5
SENSE Settling Time with Nominal Load Current Stable	$t_{sIS(ON)}$	–	5	20	µs	$I_L = I_{L(CAL)}$ from DEN rising edge to $I_{IS} = I_L / (k_{ILIS,MAX} @ I_L)$ * 0.9 See **Figure 40**	P_9.6.1.6
SENSE Settling Time with Small Load Current Stable	$t_{sIS(ON)\_SLC}$	–	–	60	µs	1) $I_L = I_{L(CAL)\_OL}$ from DEN rising edge to $I_{IS} = I_L / (k_{ILIS,MAX} @ I_L)$ * 0.9	P_9.6.1.13

Table 20 Electrical Characteristics: Diagnosis - PROFET™ (continued)

Parameter	Symbol	Values			Unit	Note or Test Condition	Number
		Min.	Typ.	Max.			
SENSE Disable Time	$t_{sIS(OFF)}$	–	5	20	µs	1) From DEN falling edge to $I_{IS} = I_{IS(OFF)}$ See **Figure 40**	P_9.6.1.8
SENSE Settling Time after Load Change	$t_{sIS(LC)}$	–	5	20	µs	1) from $I_L = I_{L(CAL)\_L}$ to $I_L = I_{L(CAL)}$ (see $\Delta k_{ILIS(NOM)}$) See **Figure 40**	P_9.6.1.9
SENSE Settling Time after Load Change with Small Load Current	$t_{sIS(LC)\_SLC}$	–	250	400	µs	1) DEN = “high” from Load Change to $I_{IS} = I_L / (k_{ILIS} @ I_L)$ from $I_{L(CAL)}$ to $I_{L(CAL)\_OL}$	P_9.6.1.14

1) Not subject to production test - specified by design.

9.6 Electrical Characteristics Diagnosis - Power Output Stages

V_S = 6 V to 18 V, T_J = -40 °C to +150 °C
Typical values: V_S = 13.5 V, T_J = 25 °C

Typical resistive load connected to the output for testing (unless otherwise specified):

R_L = 3.3 Ω

9.6.1 Diagnosis Power Output Stage - 10 mΩ

Table 21 Electrical Characteristics: Diagnosis - 10 mΩ

Parameter	Symbol	Values			Unit	Note or Test Condition	Number
		Min.	Typ.	Max.			
Open Load Output Current at I_{IS} = 4 µA	$I_{L(OL)\_4u}$	7	19	34	mA	$I_{IS} = I_{IS(OL)}$ = 4 µA See **Figure 34**	P_9.7.2.1
Current Sense Ratio at $I_L = I_{L02}$	k_{ILIS02}	-34.5%	5000	+34.5%		I_{L02} = 20 mA	P_9.7.2.6
Current Sense Ratio at $I_L = I_{L05}$	k_{ILIS05}	-25.5%	5000	+25.5%		I_{L05} = 100 mA	P_9.7.2.9
Current Sense Ratio at $I_L = I_{L08}$	k_{ILIS08}	-22.5%	5000	+22.5%		I_{L08} = 250 mA	P_9.7.2.12
Current Sense Ratio at $I_L = I_{L11}$	k_{ILIS11}	-13.0%	5000	+13.0%		I_{L11} = 1 A	P_9.7.2.15

Table 21 Electrical Characteristics: Diagnosis - 10 mΩ (continued)

Parameter	Symbol	Values			Unit	Note or Test Condition	Number
		Min.	Typ.	Max.			
Current Sense Ratio at $I_L = I_{L13}$	k_{ILIS13}	-8.1%	5000	+8.1%		I_{L13} = 2 A	P_9.7.2.17
Current Sense Ratio at $I_L = I_{L15}$	k_{ILIS15}	-4.6%	5000	+4.6%		I_{L15} = 4 A	P_9.7.2.19
Current Sense Ratio at $I_L = I_{L17}$	k_{ILIS17}	-3.9%	5000	+3.9%		I_{L17} = 7 A	P_9.7.2.21
SENSE Current Derating with Low Current Calibration	$\Delta k_{ILIS(OL)}$	-30	0	+30	%	1) $I_{L(CAL)\_OL} = I_{L05}$ $I_{L(CAL)\_OL\_H} = I_{L08}$ $I_{L(CAL)\_OL\_L} = I_{L02}$ $T_{A(CAL)}$ = 25 °C See **Figure 33**	P_9.7.2.27
SENSE Current Derating with Nominal Current Calibration	$\Delta k_{ILIS(NOM)}$	-4	0	+4	%	1) $I_{L(CAL)} = I_{L15}$ $I_{L(CAL)\_H} = I_{L17}$ $I_{L(CAL)\_L} = I_{L13}$ $T_{A(CAL)}$ = 25 °C See **Figure 33**	P_9.7.2.29

1) Not subject to production test - specified by design

10 Application Information

Note: The following information is given as a hint for the implementation of the device only and shall not be regarded as a description or warranty of a certain functionality, condition or quality of the device.

10.1 Application Setup

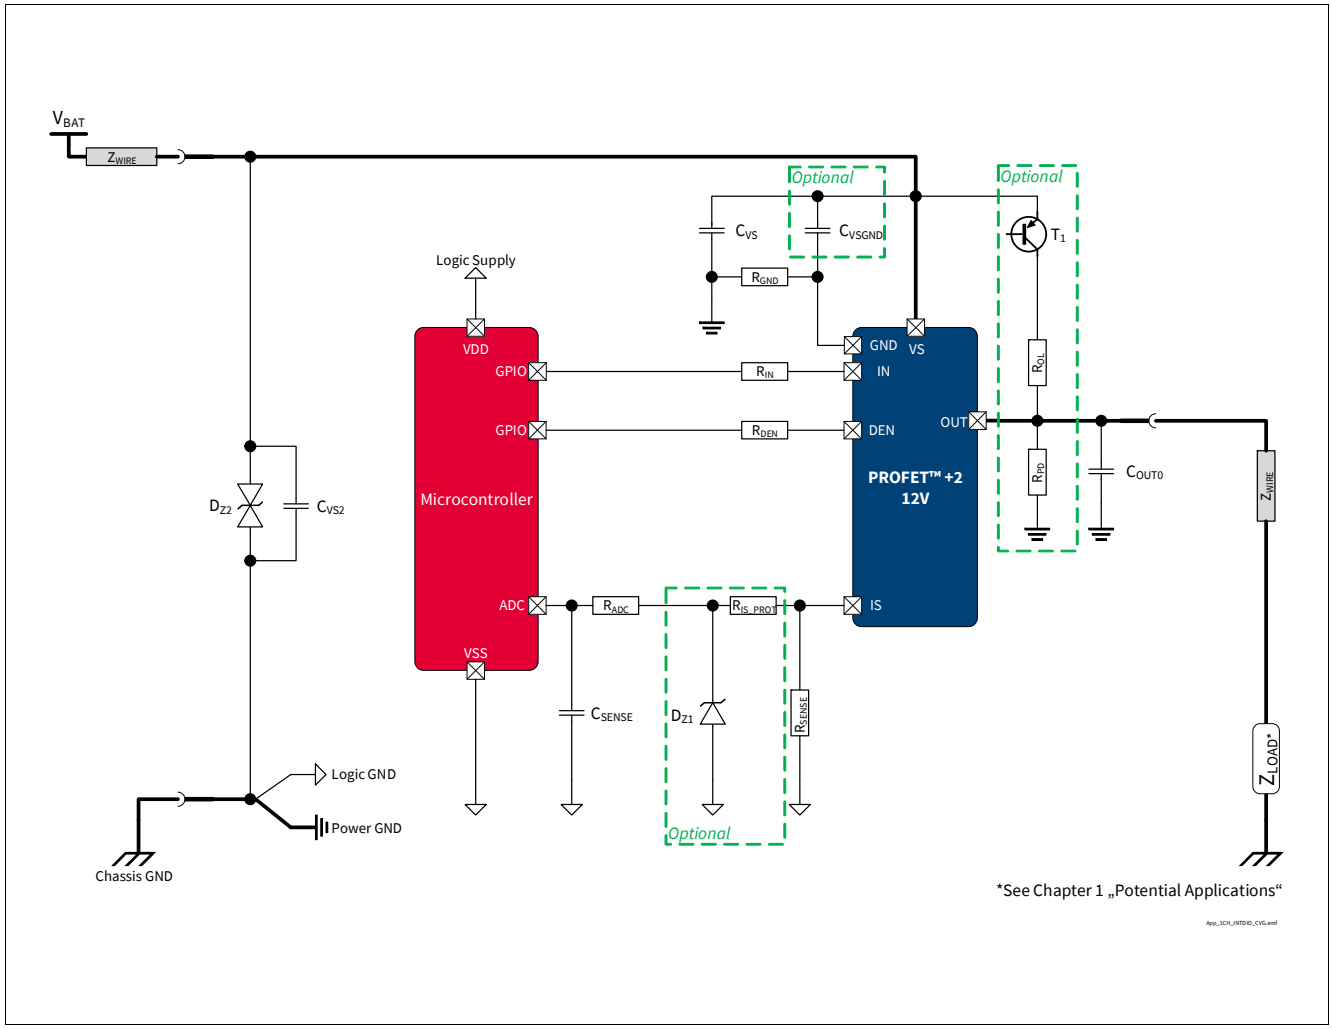

Figure 42 BTS7010-1EPA Application Diagram

Note: This is a very simplified example of an application circuit. The function must be verified in the real application.

Table 22 Loads considered for Reverse Polarity setup (see P_4.1.0.5)

Output	$R_{DS(ON),max}$ @ T_J = 150 °C	Load connected
10 mΩ	19.5 mΩ	H7_55W

10.2 External Components

Table 23 Suggested Component values

Reference	Value	Purpose
R_{IN}	4.7 kΩ	Protection of the microcontroller during Overvoltage and Reverse Polarity Necessary to switch OFF BTS7010-1EPA output during Loss of Ground
R_{DEN}	4.7 kΩ	Protection of the microcontroller during Overvoltage and Reverse Polarity Necessary to switch OFF BTS7010-1EPA output during Loss of Ground
R_{PD}	47 kΩ	Output polarization (pull-down) Ensures polarization of BTS7010-1EPA outputs to distinguish between Open Load and Short to V_S in OFF Diagnosis
R_{OL}	1.5 kΩ	Output polarization (pull-up) Ensures polarization of BTS7010-1EPA output during Open Load in OFF diagnosis
C_{OUT}	10 nF	Protection of BTS7010-1EPA output during ESD events and BCI
T_1	BC 807	Switch the battery voltage for Open Load in OFF diagnosis
C_{VS}	100 nF	Filtering of voltage spikes on the battery line
C_{VSGND}	47 nF	Buffer capacitor for fast transient See **Table 5** (P_4.3.0.7) for the boundary conditions A placeholder on PCB layout is recommended
D_{Z2}	33 V TVS Diode	Transient Voltage Suppressor diode Protection during Overvoltage and in case of Loss of Battery while driving an inductive load
C_{VS2}	–	Filtering / buffer capacitor located at V_{BAT} connector
R_{SENSE}	1.2 kΩ	SENSE resistor
R_{IS_PROT}	4.7 kΩ	Protection during Overvoltage, Reverse Polarity, Loss of Ground Value to be tuned according to microcontroller specifications
D_{Z1}	7 V Z-Diode	Protection of microcontroller during Overvoltage
R_{ADC}	4.7 kΩ	Protection of microcontroller ADC input during Overvoltage, Reverse Polarity, Loss of Ground Value to be tuned according to microcontroller specifications
C_{SENSE}	220 pF	Sense signal filtering A time constant (R_{ADC} * C_{SENSE}) longer than 1 µs is recommended
R_{GND}	47 Ω	Protection in case of Overvoltage and Loss of Battery while driving inductive loads

10.3 Further Application Information

- Please contact us for information regarding the Pin FMEA

11 Package Outlines

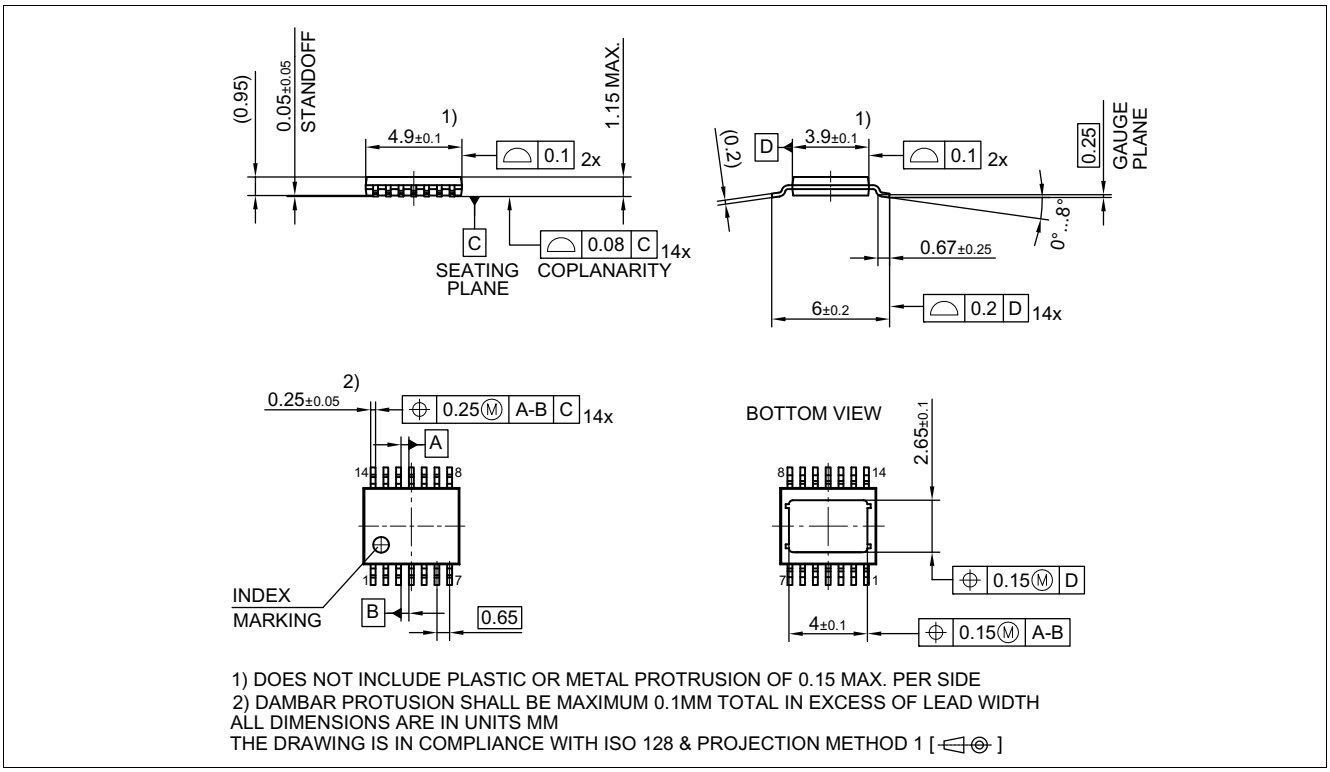

Figure 43 **PG-TSDSO-14** (Thin (Slim) Dual Small Outline 14 pins) **Package Outline**

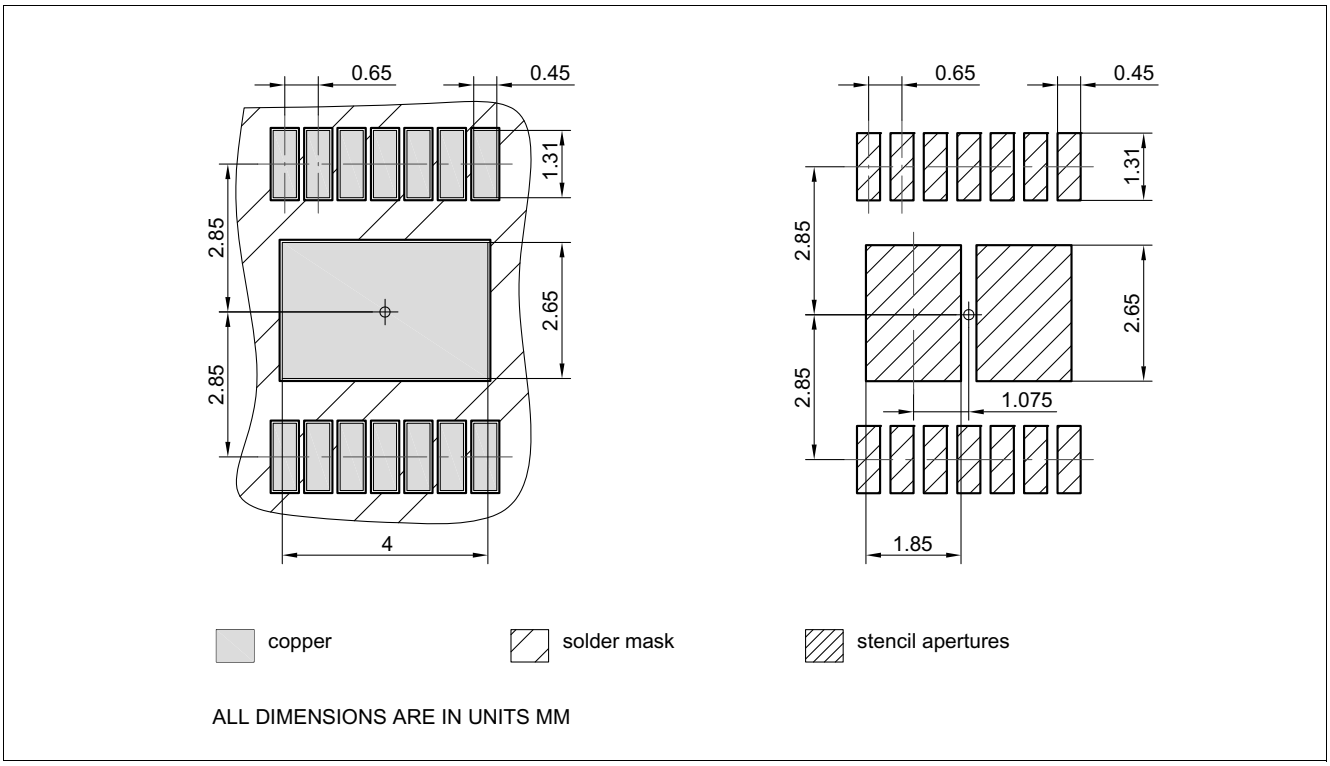

Figure 44 **PG-TSDSO-14** (Thin (Slim) Dual Small Outline 14 pins) **Package pads and stencil**

Package Outlines

Green product (RoHS compliant)

To meet the world-wide customer requirements for environmentally friendly products and to be compliant with government regulations the device is available as a green product. Green products are RoHS-Compliant (i.e Pb-free finish on leads and suitable for Pb-free soldering according to IPC/JEDEC J-STD-020).

IMPORTANT NOTICE

The information given in this document shall in no event be regarded as a guarantee of conditions or characteristics ("Beschaffenheitsgarantie").

With respect to any examples, hints or any typical values stated herein and/or any information regarding the application of the product, Infineon Technologies hereby disclaims any and all warranties and liabilities of any kind, including without limitation warranties of non-infringement of intellectual property rights of any third party.

In addition, any information given in this document is subject to customer's compliance with its obligations stated in this document and any applicable legal requirements, norms and standards concerning customer's products and any use of the product of Infineon Technologies in customer's applications.

The data contained in this document is exclusively intended for technically trained staff. It is the responsibility of customer's technical departments to evaluate the suitability of the product for the intended application and the completeness of the product information given in this document with respect to such application.

For further information on technology, delivery terms and conditions and prices, please contact the nearest Infineon Technologies Office (**www.infineon.com**).

WARNINGS

Due to technical requirements products may contain dangerous substances. For information on the types in question please contact your nearest Infineon Technologies office.

Except as otherwise explicitly approved by Infineon Technologies in a written document signed by authorized representatives of Infineon Technologies, Infineon Technologies' products may not be used in any applications where a failure of the product or any consequences of the use thereof can reasonably be expected to result in personal injury.
