

Smart Dual Lowside Power Switch

HITFET® BTS3408G

Data Sheet V1.0

Features

- Logic Level Input
- Compatible to 3V micro controllers
- ESD protection
- Thermal shutdown with auto restart
- Overload protection
- Short circuit protection
- Over voltage protection
- Open load detection (during Off)
- Current limitation
- Direct parallel control of the inputs
- FREEZE functionality for multiplexing
- · General fault flag
- · Very low standby quiescent current
- Switching frequencies up to 50kHz

Application

- All kinds of resistive, inductive and capacitive loads in switching applications
- μC compatible power switch for 12 V, 24 V and 42 V applications
- Replaces electromechanical relays and discrete circuits
- Line, stepper motor, lamp and relay driver

General Description

The BTS3408G is a dual channel Low-Side Switch with D-MOS output stages for driving resistive, capacitive and inductive loads. The design is based on Infineons Smart Power Technology (SPT) which allows bipolar, CMOS and power D-MOS devices on the same monolithic circuit.

The BTS3408RS is protected by embedded protection functions and designed for automotive and industrial applications. It is especially suited for driving stepper motors and lines.

Туре	Ordering Code	Package
HITFET® BTS3408G	Q67006-A9570-A001	P-DSO-8-3

Product Summary

Parameter	Symbol	Value	Unit
Supply voltage	V_{S}	4.5 - 60	V
Continuous drain source voltage	V_{DS}	60	V
On-state resistance	$R_{DS(ON)}$	550	mΩ
Current limitation	$I_{D(lim)}$	1	Α
Nominal output current (individual channel)	$I_{D(Nom)}$	0.55	Α
Clamping energy	E_{AS}	800	mJ

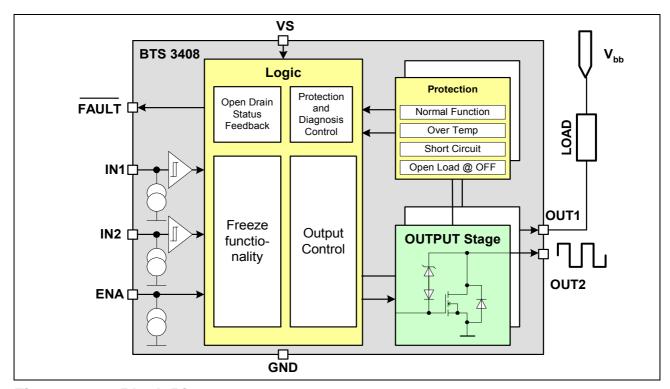

Figure 1 Block Diagram

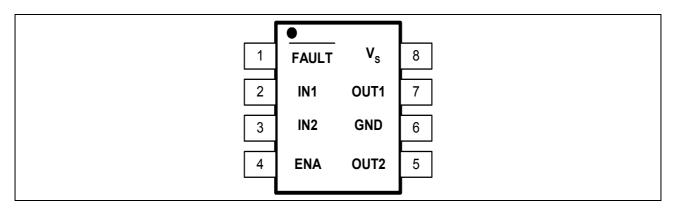

Figure 2 Pin Configuration

Pin Definitions and Functions

Pin	Symbol	Function
1	FAULT	General Fault Flag; see Table 2 for operation mode.
2	IN1	Input 1; input of channel 1; has an internal pull down; TTL/CMOS compatible input.
3	IN2	Input 2; input of channel 2; has an internal pull down; TTL/CMOS compatible input.
4	ENA	Enable/Freeze; has an internal pull down; device is enabled when voltage is higher then 1.2 Volts; if the voltage is below 1.7 Volts the output is freezed, input signals will be ignored; if the voltage is above 2 Volts input signals will be output; see Table 1 for detailed information.
5	OUT2	Output 2; output of D-MOS stage 2.
6	GND	Ground.
7	OUT1	Output 1; output of D-MOS stage 1.
8	V_{S}	Power supply.

Circuit Description

Logic Supply

The logic is supplied with 4.5 up to 60 Volt by the V_S pin. If V_S falls below max. 4.5 Volts the logic is shut down and the output stages are switched off.

Direct Inputs

ENA

The ENA/FREEZE input can be used to enable and/or to freeze the output control of the IC or to cut off the complete IC.

By pulling the ENA input to low, i.e. applying a Voltage V_{ENAL} , the IC is in disable mode. The power stages are switched off and the current consumption is reduced to $I_{\text{S(stby)}}$.

By applying a Voltage V_{ENAFZ} , the IC is in FREEZE mode. The output signals will remain in their former state. All input signals will be ignored.

By pulling the input to high, the IC is in Enable mode. All input signals are output.

The ENA - pin has an internal pull-down.

IN1 / IN2

Each output is independently controlled via the respective input pin. The input pins are high active. If the common enable pin is high, the individual input signals are output. The input pins have an internal pull-down.

Table 1 Functional Table

V _{ENA}	Mode	IN1	IN2	IN1(-1)	IN2(-1)	OUT1	OUT2	Comment
<u><0.8V</u>	Disable	X 1)	X 1)	X 1)	X 1)	L	L	all outputs OFF
1.2 1.7V	Freeze	X 1)	X 1)	L	L	L	L	former output state
1.2 1.7V	Freeze	X 1)	X 1)	L	Н	L	Н	former output state
1.2 1.7V	Freeze	X 1)	X 1)	Н	L	Н	L	former output state
1.2 1.7V	Freeze	X 1)	X 1)	Н	Н	Н	Н	former output state
≥2.0V	Enable	L	L	X 1)	X 1)	L	L	input is output
≥2.0V	Enable	L	Н	X 1)	X 1)	L	Н	input is output
≥2.0V	Enable	Н	L	X 1)	X 1)	Н	L	input is output
≥2.0V	Enable	Н	Н	X 1)	X 1)	Н	Н	input is output

¹⁾ X = not relevant

Power stages

Each output is protected by embedded protection functions. In the event of an overload or short to supply, the current is internally limited. The current limit is set to $I_{D(lim)}$. If this operation leads to an overtemperature condition, a second protection level (about 165 °C) will turn the effected output into a PWM-mode (selective thermal shutdown with restart) to prevent critical chip temperatures. The temperature hysteresis is typically 10K. Zener clamping is implemented to limit voltages at the power transistors when inductive

Diagnostic

loads are switched off.

The general FAULT pin is an open drain output. The FAULT pin is low active. It signals fault conditions of any of the two output stages. By doing so, single and/or dual fault conditions can be monitored. Single fault conditions can be assigned.

Table 2 Diagnostic Table

Operating Condition	ENA	IN _x	OUT _X	FAULT
Standby	L	X 1)	OFF	Н
Normal function	Н	Н	ON	Н
Over temperature	Н	Н	OFF ²⁾	L
Open load / short to ground	Н	L	OFF	L

¹⁾ X = not relevant

Fault Distinction

Open load / short to ground is recognized during OFF-state. Overtemperature as a result of an overload or short to battery can only arise during ON-state. If there is only one fault at a time, it is possible to distinguish which channel is affected with which fault.

²⁾ selective thermal shutdown for each channel at overtemperature

Absolute Maximum Ratings 1)

 $T_{\rm i}$ = -40°C to 150°C , unless otherwise specified

Parameter	Symbol	Values	Unit	Remarks

both channel active, $T_{j(\text{start})}$ =150°C				240		

¹⁾ See also diagram 4 on page 14.

²⁾ See also diagram 5 on page 14.

³⁾ Integrated protection functions are designed to prevent IC destruction under fault conditions described in the data sheet. Fault conditions are considered as "outside" normal operating range. Protection functions are not designed for continuous repetitive operation.

EMC-Characteristics

The following EMC-Characteristics outline the behavior of typical devices. They are not part of any production test.

Table 3 Test Conditions

Definition of functional status

Class	Content
С	All functions of the device are performed as designed after exposure to disturbance.
E	One or more function of a device does not perform as designed after exposure and can not be returned to proper operation without repairing or replacing the device. The value after the character shows the limit.

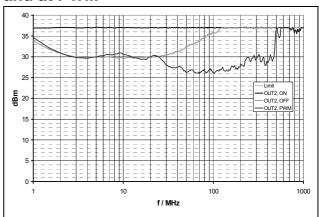

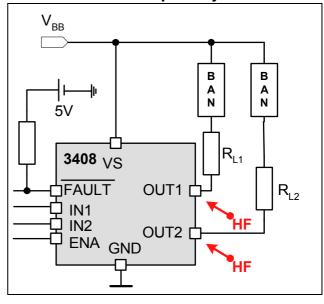

Figure 5 Test circuit for conducted susceptibility ²⁾

For defined decoupling and high reproducibility a defined choke (5µH at 1 MHz) is inserted between Vbb and Out-Pin.

Broadband Artificial Network (short BAN) consists of the same choke (5μH at 1 MHz) and the same 150ohm-matching network as for emission measurement for defined decoupling and high reproducibility.
