Description

The TLE42344G is a 5-V low-dropout fixed-voltage regulator in a PG-SOT223-4 package. The IC regulates an input voltage V_I in the range $5.5\text{ V} < V_I < 45\text{ V}$ to $V_{Q_{rated}} = 5.0\text{ V}$. The maximum output current is more than 100 mA. This IC is protected against short circuit and overheating by the integrated output current limitation and the overtemperature shutdown.

Notes

1. Stresses above the ones listed here may cause permanent damage to the device. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.
2. Integrated protection functions are designed to prevent IC destruction under fault conditions described in the datasheet. Fault conditions are considered as “outside” normal operating range. Protection functions are not designed for continuous repetitive operation.

Where applicable, a thermal via array under the exposed pad contacted the first inner copper layer.
- 3) Specified R_{thJA} value is according to Jedec JESD 51-3 at natural convection on FR4 1s0p board. The product (chip and package) was simulated on a 76.2 × 114.3 × 1.5 mm³ board with 1 copper layer (1 × 70 μm Cu).

4 Circuit description

The control amplifier compares a reference voltage, which is kept highly precise by resistance adjustment, to a voltage that is proportional to the output voltage and drives the base of the series transistor via a buffer. Saturation control, working as a function of load current, prevents any oversaturation of the power element.

Dimensioning information on external components

The input capacitor C_i is necessary for compensating line influences. The output capacitor C_o is necessary for the stability of the regulating circuit. Stability is guaranteed at values $C_o \geq 10 \mu\text{F}$ and an $\text{ESR} \leq 10 \Omega$ within the operating temperature range.
