

Established Reliability Surface Mount Capacitors, MIL-PRF-123, 50 – 100 VDC (BP & BX Dielectric)

Overview

The KEMET MIL-PRF-123 BP and BX surface mount capacitors are designed, tested and screened to meet demanding high reliability defense and aerospace applications. Being renowned in the industry, the MIL-PRF-123 is legacy specification created by the Defense Logistics Agency's (DLA) with its proven flight hours. Qualified under performance specification MIL-PRF-123 and QPL listed, this series meets or exceeds the requirements outlined by DLA and is currently available in A and T product levels. Although, the A product level insinuated space grade

through its existence, the T level provides an option for additional ultrasonic screening. This PME (precious metal electrode) product series complements the other popular DLA specifications such as the MIL-PRF-55681 (PME) and MIL-PRF-32535 (BME) offering a wider breadth of products making it easier for designers to choose the best solution.

Electrical Parameters/Characteristics

Item	Parameters/Characteristics
Operating temperature range	-55°C to +125°C
Capacitance change with reference to +25°C and 0 VDC applied (TCC)	BP: ±30 ppm/°C BX: ±15%
Aging rate (maximum % capacitance loss/decade hour)	BP: 0% BX: 1%
¹ Dielectric Withstanding Voltage (DWV)	250% of rated voltage (5 ±1 seconds and charge/discharge not exceeding 50 mA)
² Dissipation Factor (DF) maximum limit at 25°C	BP: Cap < 10 pF: 0.25% Cap ≥ 10 pF: 0.15% BX: 2.5%
³ Insulation Resistance (IR) minimum limit at 25°C	At +25°C: 100,000 megaohms or 1,000 megaohm-microfarads, whichever is less. At +125°C: 10,000 megaohms or 100 megaohm-microfarads, whichever is less.

¹ DWV is the voltage a capacitor can withstand (survive) for a short period of time. It exceeds the nominal and continuous working voltage of the capacitor.

² Capacitance and dissipation factor (DF) measured under the following conditions:

1 MHz ±100 kHz and 1.0 V_{rms} ±0.2 V if capacitance ≤ 1,000 pF

1 kHz ±50 Hz and 1.0 V_{rms} ±0.2 V if capacitance > 1,000 pF

³ To obtain IR limit, divide MΩ-μF value by the capacitance and compare to GΩ limit. Select the lower of the two limits.

Capacitance and dissipation factor (DF) measured under the following conditions:

Note: When measuring capacitance it is important to ensure the set voltage level is held constant. The HP4284 and Agilent E4980 have a feature known as automatic level control (ALC). The ALC feature should be switched to "ON."

Density Level A: For low-density product applications. It is recommended for wave solder applications and provides a wider process window for reflow solder processes. KEMET only recommends wave soldering of EIA 0603, 0805 and 1206 case sizes.

Density Level B: For products with a moderate level of component density. It provides a robust solder attachment condition for reflow solder processes.

Density Level C: For high component density product applications. Before adapting the minimum land pattern variations, the user should perform qualification testing based on the conditions outlined in IPC Standard 7351 (IPC-7351).

Image below based on Density Level B for an EIA 1210 case size.

Soldering Process

Recommended Soldering Technique:

- Solder wave or solder reflow for EIA case sizes 0603, 0805 and 1206
- All other EIA case sizes are limited to solder reflow only

Recommended Reflow Soldering Profile:

KEMET's families of Surface Mount Multilayer Ceramic Capacitors (SMD MLCCs) are compatible with wave (single or dual), convection, IR, or vapor phase reflow techniques. Preheating of these components is recommended to avoid extreme thermal stress. KEMET's recommended profile conditions for convection and IR reflow reflect the profile conditions of the IPC/J-STD-020 standard for moisture sensitivity testing. These devices can safely withstand a maximum of three reflow passes at these conditions.

Storage and Handling

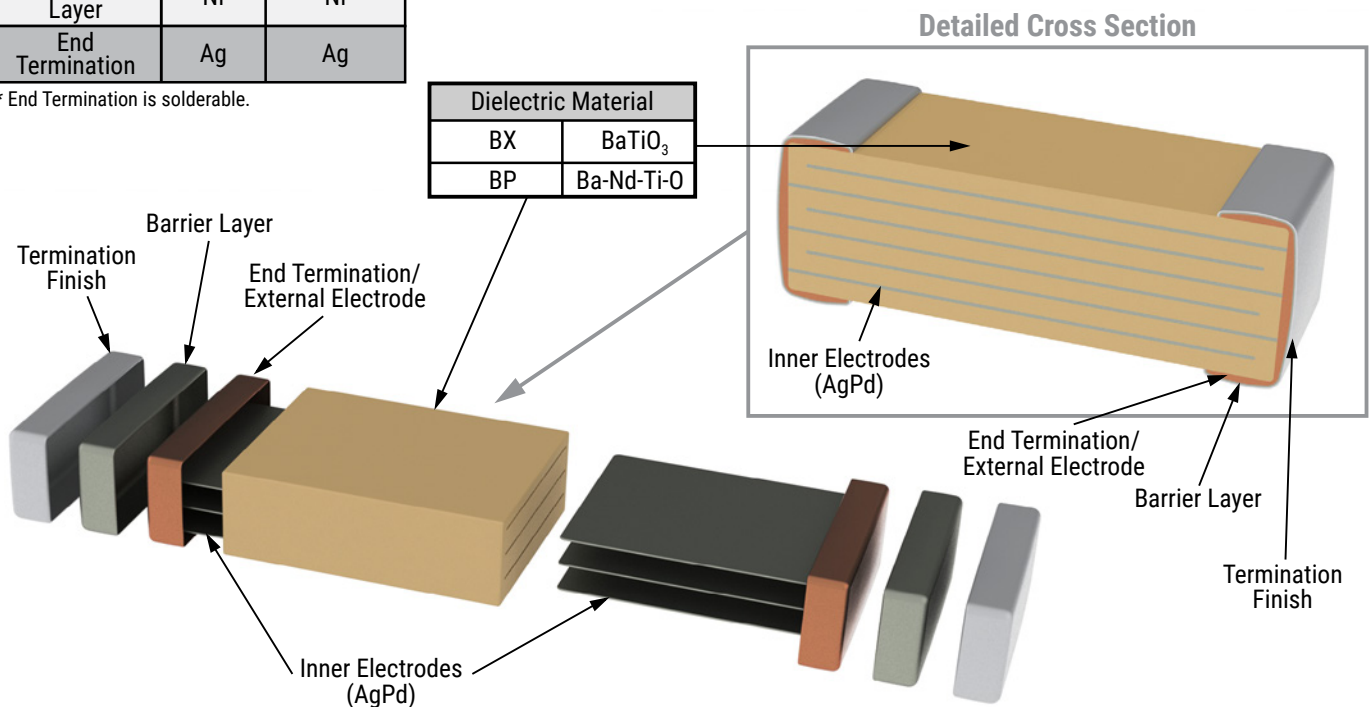

Ceramic chip capacitors should be stored in normal working environments. While the chips themselves are quite robust in other environments, solderability will be degraded by exposure to high temperatures, high humidity, corrosive atmospheres, and long term storage. In addition, packaging materials will be degraded by high temperature – reels may soften or warp and tape peel force may increase. KEMET recommends that maximum storage temperature not exceed 40°C and maximum storage humidity not exceed 70% relative humidity. In addition, temperature fluctuations should be minimized to avoid condensation on the parts. The atmospheres should be free of chlorine and sulfur bearing compounds. For optimized solderability chip stock should be used promptly, preferably within 1.5 years upon receipt.

Capacitor Marking

KEMET MIL-PRF-123 ceramic capacitors will be marked in accordance with the military specification on case sizes ≥ 0805 . Case sizes below 0805 will not be marked. Two sides of the ceramic body will be laser marked with a “K” to identify KEMET, followed by two characters to identify the capacitance value.

The marking appears in legible contrast. Illustrated below is an example of an MLCC with laser the marking of “KA5”, which designates a KEMET device with the rated capacitance of 100 nF.

- The embossment hole location shall be measured from the sprocket hole controlling the location of the embossment. Dimensions of the embossment location and the hole location shall be applied independent of each other.
- The tape with or without components, shall pass around R without damage (see Figure 6).
- If S₁ < 1.0 mm, there may not be enough area for cover tape to be properly applied (see EIA Document 481 paragraph 4.3 (b)).
- B₁ dimension is a reference dimension for a tape feeder clearance only.
- The cavity defined by A₀, B₀ and K₀ shall surround the component with sufficient clearance that:
 - The component does not protrude above the top surface of the carrier tape.
 - The component can be removed from the cavity in a vertical direction without mechanical restriction, after the top cover tape has been removed.
 - Rotation of the component is limited to 20° maximum for 8 and 12 mm tapes; 10° maximum for 16 mm tapes (see Figure 3).
 - Lateral movement of the component is restricted to 0.5 mm maximum for 8 mm and 12 mm wide tape; to 1.0 mm maximum for 16 mm tape (see Figure 4).
 - See addendum in EIA Document 481 for standards relating to more precise taping requirements.

Packaging Information Performance Notes

- Cover Tape Break Force:** 1.0 kg minimum.
- Cover Tape Peel Strength:** The total peel strength of the cover tape from the carrier tape shall be:

Tape Width	Peel Strength
8 mm	0.1 to 1.0 Newton (10 to 100 gf)
12 and 16 mm	0.1 to 1.3 Newton (10 to 130 gf)

The direction of the pull shall be opposite the direction of the carrier tape travel. The pull angle of the carrier tape shall be 165° to 180° from the plane of the carrier tape. During peeling, the carrier and/or cover tape shall be pulled at a velocity of 300 ±10 mm/minute.

- Labeling:** Bar code labeling (standard or custom) shall be on the side of the reel opposite the sprocket holes. Refer to EIA Standards 556 and 624.
