

# AUTOMOTIVE CURRENT TRANSDUCER OPEN LOOP TECHNOLOGY HSW S01

#### Introduction

The HSW family is best suited for DC and AC currents measurement in high power and high voltage automotive applications. It features galvanic separation between the primary circuit (high power) and the secondary circuit (electronic circuit).

The HSW family gives you a choice of having different current measuring ranges in the same housing (from  $\pm 50$  up to  $\pm 400$  A) or use dual output for redundancy measurement.

#### Features

- Open Loop transducer using the Hall effect
- Low voltage application
- Unipolar +5 V DC power supply
- Primary current measuring range up to ±200 A
- Operating temperature range: -40 °C < T < +85 °C
- Output voltage: full ratio-metric (in sensitivity and offset).

#### **Advantages**

- Good accuracy
- Good linearity
- · Low magnetic offset
- · Low thermal offset drift
- Low thermal sensitivity drift.

#### Automotive applications

- Battery pack monitoring
- Hybrid vehicles
- EV and utility vehicles.

#### **Principle of HSW Family**

The open loop transducers uses a Hall effect integrated circuit. The magnetic flux density B, contributing to the rise of the Hall

voltage, is generated by the primary current  $I_{\rm p}$  to be measured.

The current to be measured  $I_{\rm p}$  is supplied by a current source i.e. battery or generator (Figure 1).

Within the linear region of the hysteresis cycle, *B* is proportional to:

$$B (I_{\rm P}) = a \times I_{\rm P}$$
  
The Hall voltage is thus expressed by:  
$$U_{\rm H} = (c_{\rm H} / d) \times I_{\rm H} \times a \times I_{\rm P}$$

Except for  $I_{\rm p}$  all terms of this equation are constant. Therefore:

$U_{\rm H} = b \times b$	r P
a	constant
b	constant
C <sub>H</sub>	Hall coefficient
d	thickness of the Hall plate

I<sub>H</sub> current across the Hall plates

The measurement signal  $U_{\rm H}$  amplified to supply the user output voltage or current.

#### **Electronic schematic**

## Remarks

- $I_{\mathsf{P}} = \left(\frac{5}{U_{\mathsf{C}}} \times U_{\mathsf{out}} U_{\mathsf{O}}\right) \times \frac{1}{S}$  with S in (V/A)
- $U_{out} > U_{o}$  when  $I_{p}$  flows in the positive direction (see arrow on drawing).

# System architecture (example)

 $C_{\rm L}$  < 100 nF EMC protection (optional)  $R_{\rm c}$  Low pass filter (optional)

On board diagnostic

 $R_{\rm L} > 10 \text{ K}\Omega$ . Resistor for signal line diagnostic (optional)

U <sub>out</sub>	Diagnostic
Open circuit	U <sub>IN</sub> ≤ 0.15 V
Short GND	U <sub>IN</sub> ≤ 0.15 V

#### PERFORMANCES PARAMETERS DEFINITIONS

#### Primary current definition:

# Definition of typical, minimum and maximum values:

Minimum and maximum values for specified limiting and safety conditions have to be understood as such as values shown in "typical" graphs. On the other hand, measured values are part of a statistical distribution that can be specified by an interval with upper and lower limits and a probability for measured values to lie within this interval. Unless otherwise stated (e.g. "100 % tested"), the LEM definition for such intervals designated with "min" and "max" is that the probability for values of samples to lie in this interval is 99.73 %. For a normal (Gaussian) distribution, this corresponds to an interval between -3 sigma and +3 sigma. If "typical" values are not obviously mean or average values, those values are defined to delimit intervals with a probability of 68.27 %, corresponding to an interval between -sigma and +sigma for a normal distribution. Typical, minimum and maximum values are determined during the initial characterization of a product.

#### Output noise voltage:

The output voltage noise is the result of the noise floor of the Hall elements and the linear amplifier.

#### Magnetic offset:

The magnetic offset is the consequence of an any current on the primary side. It's defined after a stated excursion of primary current.

#### Linearity:

The maximum positive or negative discrepancy with a reference

straight line  $U_{out} = f(I_P)$ . Unit: linearity (%) expressed with full scale of  $I_{PN}$ .

## **Delay time** $t_{D 90}$ :

The time between the primary current signal  $(I_{\rm P\ N})$  and the output signal reach at 90 % of its final value.

#### Sensitivity:

The transducer's sensitivity *S* is the slope of the straight line  $U_{out} = f(I_p)$ , it must establish the relation:

$$U_{\text{out}} (I_{\text{P}}) = U_{\text{C}}/5 (S \times I_{\text{P}} + U_{\text{O}})$$

#### **Offset with temperature:**

The error of the offset in the operating temperature is the variation of the offset in the temperature considered with the initial offset at 25  $^\circ$ C.

The offset variation  $I_{0T}$  is a maximum variation the offset in the temperature range:

$$I_{OT} = I_{OE} \max - I_{OE} \min$$

The offset drift  $TCI_{\rm O~E~AV}$  is the  $I_{\rm O~T}$  value divided by the temperature range.

#### Sensitivity with temperature:

The error of the sensitivity in the operating temperature is the relative variation of sensitivity with the temperature considered with the initial offset at 25  $^{\circ}$ C.

The sensitivity variation  $S_{\tau}$  is the maximum variation (in ppm or %) of the sensitivity in the temperature range:

 $S_{\tau}$  = (Sensitivity max – Sensitivity min) / Sensitivity at 25 °C.

The sensitivity drift *TCS* <sub>AV</sub> is the  $S_{\tau}$  value divided by the temperature range. Deeper and detailed info available is our LEM technical sales offices (www.lem.com).

#### Offset voltage @ $I_p = 0$ A:

The offset voltage is the output voltage when the primary current is zero. The ideal value of  $U_{\rm o}$  is  $U_{\rm c}/2$ . So, the difference of  $U_{\rm o} - U_{\rm c}/2$  is called the total offset voltage error. This offset error can be attributed to the electrical offset (due to the resolution of the ASIC quiescent voltage trimming), the magnetic offset, the thermal drift and the thermal hysteresis. Deeper and detailed info available is our LEM technical sales offices (www.lem. com).

#### **Environmental test specifications:**

Refer to LEM GROUP test plan laboratory CO.11.11.515.0 with "Tracking\_Test Plan\_Auto" sheet.
