

Current transducer CASR/SP6 series $I_{PN} = 6, 15, 25, 50 \text{ A}$

Ref: CASR 6-NP/SP6, CASR 15-NP/SP6, CASR 25-NP/SP6, CASR 50-NP/SP6

For the electronic measurement of currents: DC, AC, pulsed..., with galvanic separation between the primary circuit and the secondary circuit.

Features

- Closed loop (compensated) multi-range current transducer
- Voltage output
- Single supply
- Insulated plastic case material recognized according to UL 94-V0
- Compact design for PCB mounting.

Special feature

- Shorter pins.

Advantages

- Very low temperature coefficient of offset
- Very good dv/dt immunity
- LTSP compatible footprint
- Reduced height
- Reference pin with two modes: Ref IN and Ref OUT
- Extended measuring range for unipolar measurement.

Applications

- AC variable speed and servo motor drives
- Static converters for DC motor drives
- Battery supplied applications
- Uninterruptible Power Supplies (UPS)
- Switched Mode Power Supplies (SMPS)
- Power supplies for welding applications
- Solar inverters.

Standards

- EN 50178: 1997
- IEC 61010-1: 2010
- UL 508: 2013.

Application Domains

- Industrial.

Absolute maximum ratings

Parameter	Symbol	Unit	Value
Maximum supply voltage	$U_{C \max}$	V	7
Maximum primary conductor temperature	$T_{B \max}$	°C	110
Maximum primary current	$I_{P \max}$	A	$20 \times I_{PN}$
Maximum electrostatic discharge voltage (HBM)	$U_{ESD \text{ HBM max}}$	kV	4

Stresses above these ratings may cause permanent damage. Exposure to absolute maximum ratings for extended periods may degrade reliability.

UL 508: Ratings and assumptions of certification

File # E189713 Volume: 2 Section: 1

Standards

- CSA C22.2 NO. 14-10 INDUSTRIAL CONTROL EQUIPMENT - Edition 11
- UL 508 STANDARD FOR INDUSTRIAL CONTROL EQUIPMENT - Edition 17

Ratings

Parameter	Symbol	Unit	Value
Primary involved potential		V AC/DC	600
Ambient operating temperature	T_A	°C	105
Primary current	I_P	A	According to series primary currents
Supply voltage	U_C	V DC	5
Output voltage	U_{out}	V	0 to 5

Conditions of acceptability

When installed in the end-use equipment, consideration shall be given to the following:

- 1 - *These devices must be mounted in a suitable end-use enclosure.*
- 4 - *CASR series intended to be mounted on the printed circuit wiring board of the end-use equipment (with a minimum CTI of 100).*
- 5 - *CASR series shall be used in a pollution degree 2.*
- 8 - *Low voltage circuits are intended to be powered by a circuit derived from an isolating source (such as transformer, optical isolator, limiting impedance or electro-mechanical relay) and having no direct connection back to the primary circuit (other than through the grounding means).*
- 11 - *CASR series: based on results of temperature tests, in the end-use application, a maximum of 100 °C cannot be exceeded at soldering joint between primary coil pin and soldering point (corrected to the appropriate evaluated max. surrounding air).*

Marking

Only those products bearing the UL or UR Mark should be considered to be Listed or Recognized and covered under UL's Follow-Up Service. Always look for the Mark on the product.

Insulation coordination

Parameter	Symbol	Unit	Value	Comment
RMS voltage for AC insulation test, 50 Hz, 1 min	U_d	kV	4.1	
Impulse withstand voltage 1.2/50 μ s	U_{Ni}	kV	7.5	
Partial discharge extinction RMS voltage @ 10 pC	U_e	V	1000	
Clearance (pri. - sec.)	d_{Cl}	mm	7.5	Shortest distance through air
Creepage distance (pri. - sec.)	d_{Cp}	mm	7.5	Shortest path along device body
Creepage distance (pri. - sec.)	d_{Cp}	mm	6.2	When mounted on PCB with recommended layout
Case material	-	-	V0 according to UL 94	
Comparative tracking index	CTI		600	
Application example	-	-	300 V CAT III PD2	Reinforced insulation, non uniform field according to EN 50178, EN 61010
Application example	-	-	600 V CAT III PD2	Basic insulation, non uniform field according to EN 50178, EN 61010
According to UL 508: primary potential involved in Volts RMS AC or DC	-	V	600	For use in a pollution degree 2 environment

Figure 28: I_p vs T_A for CASR 50-NP/SP6

The maximum continuous DC primary current plot shows the boundary of the area for which all the following conditions are true:

- $I_p < I_{PM}$
- Junction temperature $T_j < 125$ °C
- Primary conductor temperature < 110 °C
- Resistor power dissipation $< 0.5 \times$ rated power

Frequency derating

Figure 29: Maximum RMS AC primary current / maximum DC primary current vs frequency

Performance parameters definition

Ampere-turns and amperes

The transducer is sensitive to the primary current linkage Θ_p (also called ampere-turns).

$$\Theta_p = N_p I_p (\text{At})$$

Where N_p the number of primary turn (1, 2 or 3 depending on the connection of the primary jumpers)

Caution: As most applications will use the transducer with only one single primary turn ($N_p = 1$), much of this datasheet is written in terms of primary current instead of current linkages. However, the ampere-turns (At) unit is used to emphasize that current linkages are intended and applicable.

Transducer simplified model

The static model of the transducer at temperature T_A is:

$$U_{\text{out}} = S \Theta_p + \varepsilon$$

In which $\varepsilon =$

$$U_{\text{OE}} + U_{\text{OT}}(T_A) + \varepsilon_G \cdot \Theta_p \cdot S + \varepsilon_L(\Theta_{\text{Pmax}}) \cdot \Theta_{\text{Pmax}} \cdot S + TCS \cdot (T_A - 25) \cdot \Theta_p \cdot S$$

- With:
- $\Theta_p = N_p I_p$:the input ampere-turns (At)
Please read above warning.
 - Θ_{Pmax} :the maxi input ampere-turns that have been applied to the transducer (At)
 - U_{out} :the secondary voltage (V)
 - T_A :the ambient temperature ($^{\circ}\text{C}$)
 - U_{OE} :the electrical offset voltage (V)
 - $U_{\text{OT}}(T_A)$:the temperature variation of U_{O} at temperature T_A (V)
 - S :the sensitivity of the transducer (V/At)
 - ε_S :the sensitivity error
 - $\varepsilon_L(\Theta_{\text{Pmax}})$:the linearity error for Θ_{Pmax}

This model is valid for primary ampere-turns Θ_p between $-\Theta_{\text{Pmax}}$ and $+\Theta_{\text{Pmax}}$ only.

Definition of typical, minimum and maximum values

Minimum and maximum values for specified limiting and safety conditions have to be understood as such as well as values shown in "typical" graphs.

On the other hand, measured values are part of a statistical distribution that can be specified by an interval with upper and lower limits and a probability for measured values to lie within this interval.

Unless otherwise stated (e.g. "100 % tested"), the LEM definition for such intervals designated with "min" and "max" is that the probability for values of samples to lie in this interval is 99.73 %.

For a normal (Gaussian) distribution, this corresponds to an interval between -3 sigma and $+3$ sigma. If "typical" values are not obviously mean or average values, those values are defined to delimit intervals with a probability of 68.27 %, corresponding to an interval between $-\text{sigma}$ and $+\text{sigma}$ for a normal distribution.

Typical, minimum and maximum values are determined during the initial characterization of the product.

Sensitivity and linearity

To measure sensitivity and linearity, the primary current (DC) is cycled from 0 to I_{p1} then to $-I_{p1}$ and back to 0 (equally spaced $I_p/10$ steps).

The sensitivity S is defined as the slope of the linear regression line for a cycle between $\pm I_{pN}$.

The linearity error ε_L is the maximum positive or negative difference between the measured points and the linear regression line, expressed in % of I_{pN} .

Magnetic offset

The magnetic offset current I_{OM} is the consequence of a current on the primary side ("memory effect" of the transducer's ferromagnetic parts). It is included in the linearity figure but can be measured individually.

It is measured using the following primary current cycle. I_{OM} depends on the current value I_{p1} .

$$I_{\text{OM}} = \frac{U_{\text{out}}(t_1) - U_{\text{out}}(t_2)}{2} \times \frac{1}{S_N}$$

Figure 30: Current cycle used to measure magnetic and electrical offset (transducer supplied)

Performance parameters definition (continued)

Electrical offset

The electrical offset voltage U_{OE} can either be measured when the ferro-magnetic parts of the transducer are:

- completely demagnetized, which is difficult to realize,
- or in a known magnetization state, like in the current cycle shown in figure 30.

Using the current cycle shown in figure 30, the electrical offset is:

$$U_{OE} = \frac{U_{out}(t_1) + U_{out}(t_2)}{2}$$

The temperature variation U_{OT} of the electrical offset voltage U_{OE} is the variation of the electrical offset from 25 °C to the considered temperature:

$$U_{OT}(T) = U_{OE}(T) - U_{OE}(25\text{ °C})$$

Note: the transducer has to be demagnetized prior to the application of the current cycle (for example with a demagnetization tunnel).

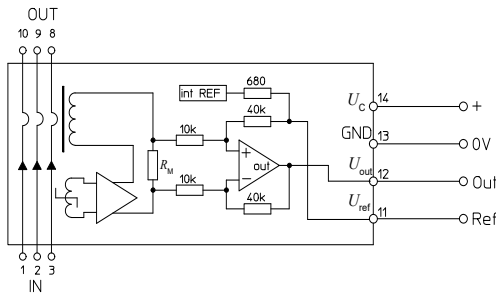

Figure 31: Test connection

Overall accuracy

The overall accuracy at 25 °C ϵ_S is the error in the $-I_{PN} \dots +I_{PN}$ range, relative to the rated value I_{PN} .

It includes:

- the electrical offset U_{OE}
- the sensitivity error ϵ_S
- the linearity error ϵ_L (to I_{PN})

The magnetic offset is part of the overall accuracy. It is taken into account in the linearity error figure provided the transducer has not been magnetized by a current higher than I_{PN} .

Delay and reaction times

The delay time t_{D90} and the reaction time t_{D10} are shown in figure 32.

Both depend on the primary current di/dt . They are measured at nominal ampere-turns.

Figure 32: Delay time t_{D90} and reaction time t_{D10}

Application information

Filtering and decoupling

Supply voltage U_C

The fluxgate oscillator draws current pulses of up to 30 mA at a rate of ca. 900 kHz. Significant 900 kHz voltage ripple on U_C can indicate a power supply with high impedance. At these frequencies the power supply rejection ratio is low, and the ripple may appear on the transducer output U_{out} and reference U_{ref} . The transducer has internal decoupling capacitors, but in the case of a power supply with high impedance, it is advised to provide local decoupling (100 nF or more, located close to the transducer)

Output U_{out}

The output U_{out} has a very low output impedance of typically 2 Ohms; it can drive 100 pF directly. Adding series $R_f = 100$ Ohms allows much larger capacitive loads. Empirical evaluation may be necessary to obtain optimum results. The minimum load resistance on U_{out} is 1 kOhm.

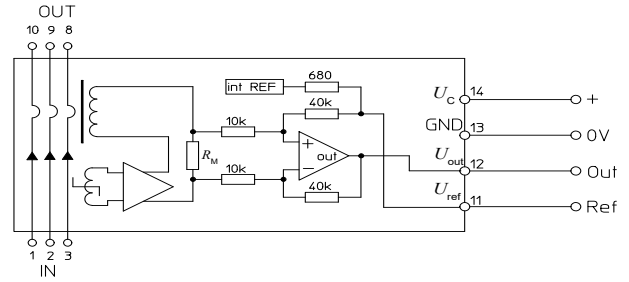

Total Primary Resistance

The primary resistance is 0.72 mΩ per conductor. In the following table, examples of primary resistance according to the number of primary turns.

Number of primary turns	Primary resistance R_p [mΩ]	Recommended connections
1	0.24	
2	1.08	
3	2.16	

Reference U_{ref}

Ripple present on the reference output can be filtered with a low value of capacitance because of the internal 680 Ohm series resistance. The maximum filter capacitance value is 1 μF.

Application information (continued)

External reference voltage

If the Ref pin of the transducer is not used it could be either left unconnected or filtered according to the previous paragraph "Reference U_{ref} ".

The Ref pin has two modes Ref IN and Ref OUT:

- In the Ref OUT mode the 2.5 V internal precision reference is used by the transducer as the reference point for bipolar measurements; this internal reference is connected to the Ref pin of the transducer through a 680 Ohms resistor. it tolerates sink or source currents up to ± 5 mA, but the 680 Ohms resistor prevents this current to exceed these limits.
- In the Ref IN mode, an external reference voltage is connected to the Ref pin; this voltage is specified in the range 0 to 4 V and is directly used by the transducer as the reference point for measurements. The external reference voltage U_{ref} must be able:

- either to source a typical current of $\frac{U_{ref} - 2.5}{680}$, the maximum value will be 2.2 mA typ. when $U_{ref} = 4$ V.

- or to sink a typical current of $\frac{2.5 - U_{ref}}{680}$, the maximum value will be 3.68 mA typ. when $U_{ref} = 0$ V.

The following graphs show how the measuring range of each transducer version depends on the external reference voltage value U_{ref} .

Upper limit: $I_p = -9.6 * U_{ref} + 44.4$ ($U_{ref} = 0 \dots 4$ V)

Lower limit: $I_p = -9.6 * U_{ref} + 3.6$ ($U_{ref} = 0 \dots 4$ V)

Upper limit: $I_p = -24 * U_{ref} + 111$ ($U_{ref} = 1.29 \dots 4$ V)

Upper limit: $I_p = 80$ ($U_{ref} = 0 \dots 1.29$ V)

Lower limit: $I_p = -24 * U_{ref} + 9$ ($U_{ref} = 0 \dots 3.7$ V)

Lower limit: $I_p = -80$ ($U_{ref} = 3.7 \dots 4$ V)

External reference voltage (continued)

Upper limit: $I_p = -40 * U_{ref} + 185$ ($U_{ref} = 2.5 \dots 4$ V)
 Upper limit: $I_p = 85$ ($U_{ref} = 0 \dots 2.5$ V)
 Lower limit: $I_p = -40 * U_{ref} + 15$ ($U_{ref} = 0 \dots 2.5$ V)
 Lower limit: $I_p = -85$ ($U_{ref} = 2.5 \dots 4$ V)

Example with $U_{ref} = 1.65$ V:

- The 6 A version has a measuring range from -12.24 A to +28.5 A
- The 15 A version has a measuring range from -30.6 A to +71.4 A
- The 25 A version has a measuring range from -51 A to +85 A
- The 50 A version has a measuring range from -102 A to +150 A

Example with $U_{ref} = 0$ V:

- The 6 A version has a measuring range from +3.6 A to +44.4 A
- The 15 A version has a measuring range from +9 A to +80 A
- The 25 A version has a measuring range from +15 A to +85 A
- The 50 A version has a measuring range from +30 A to +150 A

Upper limit: $I_p = -80 * U_{ref} + 370$ ($U_{ref} = 2.75 \dots 4$ V)
 Upper limit: $I_p = 150$ ($U_{ref} = 0 \dots 2.75$ V)
 Lower limit: $I_p = -80 * U_{ref} + 30$ ($U_{ref} = 0 \dots 2.25$ V)
 Lower limit: $I_p = -150$ ($U_{ref} = 2.25 \dots 4$ V)

PCB footprint

Assembly on PCB

- Recommended PCB hole diameter 1.3 mm for primary pin
0.8 mm for secondary pin
- Maximum PCB thickness 2.4 mm
- Wave soldering profile maximum 260 °C
for 10 s

No clean process only.

Safety

This transducer must be used in limited-energy secondary circuits according to IEC 61010-1.

This transducer must be used in electric/electronic equipment with respect to applicable standards and safety requirements in accordance with the manufacturer's operating instructions.

Caution, risk of electrical shock

When operating the transducer, certain parts of the module can carry hazardous voltage (eg. primary busbar, power supply). Ignoring this warning can lead to injury and/or cause serious damage. This transducer is a build-in device, whose conducting parts must be inaccessible after installation. A protective housing or additional shield could be used. Main supply must be able to be disconnected.

Dimensions (in mm. General linear tolerance ± 0.25 mm)
