

AUTOMOTIVE CURRENT TRANSDUCER OPEN LOOP TECHNOLOGY

HAH1BV S/D24

Introduction

The HAH1BV family is for the electronic measurement of DC, and low frequency current in high power and low voltage automotive applications with galvanic separation between the primary circuit (high power) and the secondary circuit (electronic circuit).

The HAH1BV family gives you the choice of having different current measuring ranges in the same housing.

Features

- Ratiometric transducer
- Open Loop transducer using the Hall effect
- Low voltage application
- Unipolar +5 V DC power supply
- Primary current measuring range -600 A / +300 A (high range) -100 A / +150 A (low range)
- Maximum RMS primary admissible current: defined by busbar to have $T < +150\text{ }^{\circ}\text{C}$
- Operating temperature range: $-40\text{ }^{\circ}\text{C} < T < 70\text{ }^{\circ}\text{C}$
- Output voltage: full ratio-metric (in sensitivity and offset)
- Customer 2D Matrix.

Special features

- Compressor limiter for M6 screw
- Dual output
- Unsealed connector.

Advantages

- Excellent accuracy
- Very good linearity
- Very low thermal offset drift
- Very low thermal sensitivity drift
- Galvanic separation
- Non intrusive solution.

N° 97.D3.99.D24.0

26October2017/version 0

Automotive application

- Battery Management.

Principle of HAH1BV Family

The open loop transducers uses a Hall effect integrated circuit. The magnetic flux density B , contributing to the rise of the Hall voltage, is generated by the primary current I_p to be measured. The current to be measured I_p is supplied by a current source i.e. battery or generator (Figure 1).

Within the linear region of the hysteresis cycle, B is proportional to:

$$B(I_p) = \text{constant}(a) \times I_p$$

The Hall voltage is thus expressed by:

$$V_H = (\text{Hall coefficient} / d) \times I \times \text{constant}(a) \times I_p$$

With d = thickness of the Hall plates

$$I = \text{current across the Hall plates}$$

Except for I_p , all terms of this equation are constant. Therefore:

$$V_H = \text{constant}(b) \times I_p$$

The measurement signal V_H amplified to supply the user output voltage or current.

Fig. 1: Principle of the open loop transducer

Absolute ratings (not operating)

Parameter	Symbol	Unit	Specification			Conditions
			Min	Typical	Max	
Maximum primary current peak	$I_{P\ max}$	A			2)	
Supply over voltage	U_c	V			14	
Reverse voltage			-14			
Maximum output voltage	$V_{out\ max}$	V	-14		14	
Maximum output current	$I_{out\ max}$	mA	-10		10	
Output short-circuit duration	t_c	°C			∞	
Electrostatic discharge voltage (HBM)	U_{ESD}	kV			8	JESD22-A114-B
Rms voltage for AC insulation test	U_d	kV			2	50 Hz, 1 min ISO 6469 3622
Insulation resistance	R_{INS}	MΩ	1000			500 V - ISO 16750-2
Ambient storage temperature	T_s	°C	-40		125	50 Hz, 1 min ISO 6469 3622
Creepage distance	d_{cp}	mm	5			
Clearance	d_{cl}	mm	3.87			
Comparative tracking index	CTI		PLC3 (175 V - 250 V)			

Operating characteristics in high/low range ($I_{P\ N}$)

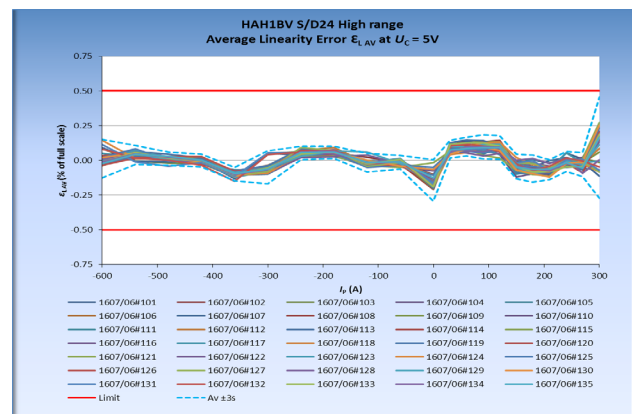

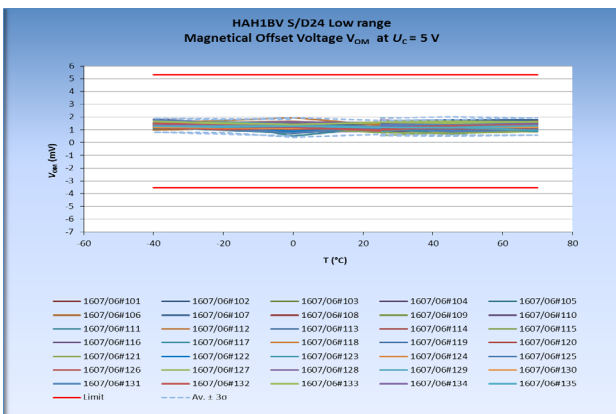

Parameter	Symbol	Unit	Specification			Conditions
			Min	Typical	Max	
Electrical Data						
Primary current, measuring range, high range	$I_{P\ M}$	A	-600		300	2)
Primary current, measuring range, low range	$I_{P\ M}$	A	-100		150	2)
Supply voltage ¹⁾	U_c	V	4.75	5	5.25	
Ambient operating temperature	T_A	°C	-40		70	
Output voltage	V_{out}	V	$V_{out} = (U_c/5) \times (V_o + G \times I_p)$			
Sensitivity high range	G	mV/A		4.444		@ $T_A = 25\ ^\circ\text{C}$
Sensitivity low range	G	mV/A		16		@ $T_A = 25\ ^\circ\text{C}$
Offset voltage high range	V_o	V		3.167		@ $T_A = 25\ ^\circ\text{C}$
Offset voltage low range	V_o	V		2.1		@ $T_A = 25\ ^\circ\text{C}$
Output resolution		mV		1.25		
Output clamping high voltage	V_{SZ}	V	4.74	4.75		@ $U_c = 5\ \text{V}$
Output clamping low voltage	V_{SZ}	V		0.25	0.26	@ $U_c = 5\ \text{V}$
Current consumption	I_c	mA		14	21	@ $T_A = 25\ ^\circ\text{C}$, @ $U_c = 5\ \text{V}$
Load resistance	R_L	KΩ	10			@ $T_A = 25\ ^\circ\text{C}$
Output internal resistance	R_{out}	Ω		1	10	@ $T_A = 25\ ^\circ\text{C}$
Performance Data						
Ratiometricity error	ϵ_r	%		±0.2		@ $T_A = 25\ ^\circ\text{C}$
Sensitivity error	ϵ_G	%	-1.5		1.5	@ $T_A = 25\ ^\circ\text{C}$ (initial state)
			-2.72		2.72	@ $T_A = 25\ ^\circ\text{C}$, after endurance test
Electrical offset voltage	V_{OE}	mV	-20		20	@ $T_A = 25\ ^\circ\text{C}$, @ $U_c = 5\ \text{V}$ (initial state)
			-33		33	@ $T_A = 25\ ^\circ\text{C}$, after endurance test
Magnetic offset voltage low range	V_{OM}	mV	-3.54		5.31	@ $U_c = 5\ \text{V}$, in temperature range
Magnetic offset voltage high range			-5.90		2.95	@ $U_c = 5\ \text{V}$, in temperature range
Linearity error	ϵ_L	%	-0.5		0.5	% of full scale, @ $T_A = 25\ ^\circ\text{C}$
Average temperature coefficient of V_{OE}	$TCV_{OE\ AV}$	mV/°C	-0.113		0.113	
Average temperature coefficient of G	TCG_{AV}	%/°C	-0.03		0.03	
Step response time @ 90 %	t_f	ms			10	
Frequency bandwidth ²⁾	BW	Hz		140		@ -3 dB
Peak-to-peak noise voltage	$V_{no\ pp}$	mV			10	DC to 1 MHz
Output rms voltage noise	V_{no}	mV			1.6	
Start-up time	t_{start}	ms			10	@ $U_c = 4.75\ \text{V}$
Setting time after overload	t_s	ms			10	

Notes: ¹⁾ The output voltage V_{out} is fully ratiometric. The offset and sensitivity are dependent on the supply voltage U_c relative to the following formula:

$$I_p = \left(\frac{5}{U_c} \times V_{out} - V_o \right) \times \frac{1}{G} \text{ with } G \text{ in (V/A)}$$

²⁾ Primary current frequencies must be limited in order to avoid excessive heating of the busbar, magnetic core and the ASIC (see feature paragraph in page 1.)

Data from PV tests

PERFORMANCES PARAMETERS DEFINITIONS
Primary current definition:

Definition of typical, minimum and maximum values:

Minimum and maximum values for specified limiting and safety conditions have to be understood as such as values shown in "typical" graphs. On the other hand, measured values are part of a statistical distribution that can be specified by an interval with upper and lower limits and a probability for measured values to lie within this interval. Unless otherwise stated (e.g. "100 % tested"), the LEM definition for such intervals designated with "min" and "max" is that the probability for values of samples to lie in this interval is 99.73 %. For a normal (Gaussian) distribution, this corresponds to an interval between -3 sigma and +3 sigma. If "typical" values are not obviously mean or average values, those values are defined to delimit intervals with a probability of 68.27 %, corresponding to an interval between -sigma and +sigma for a normal distribution. Typical, minimum and maximum values are determined during the initial characterization of a product.

Output noise voltage:

The output voltage noise is the result of the noise floor of the Hall elements and the linear amplifier.

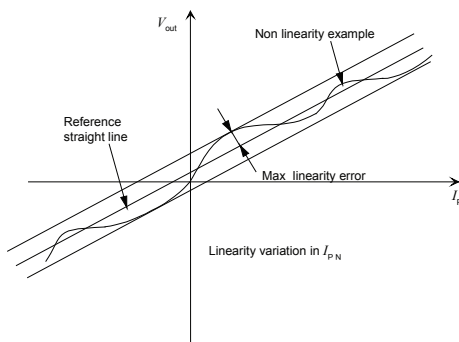

Magnetic offset:

The magnetic offset is the consequence of an over-current on the primary side. It's defined after an excursion of $I_{p,N}$.

Linearity:

The maximum positive or negative discrepancy with a reference straight line $V_{out} = f(I_p)$.

Unit: linearity (%) expressed with full scale of $I_{p,N}$.

Response time (delay time) t_r :

The time between the primary current signal ($I_{p,N}$) and the output signal reach at 90 % of its final value.

Sensitivity:

The transducer's sensitivity G is the slope of the straight line $V_{out} = f(I_p)$, it must establish the relation:

$$V_{out}(I_p) = U_c/5 (G \times I_p + V_o)$$

Offset with temperature:

The error of the offset in the operating temperature is the variation of the offset in the temperature considered with the initial offset at 25 °C.

The offset variation I_{OT} is a maximum variation the offset in the temperature range:

$$I_{OT} = I_{OE \max} - I_{OE \min}$$

The offset drift TCI_{OEAV} is the I_{OT} value divided by the temperature range.

Sensitivity with temperature:

The error of the sensitivity in the operating temperature is the relative variation of sensitivity with the temperature considered with the initial offset at 25 °C.

The sensitivity variation G_T is the maximum variation (in ppm or %) of the sensitivity in the temperature range:

$$G_T = (\text{Sensitivity max} - \text{Sensitivity min}) / \text{Sensitivity at } 25 \text{ }^\circ\text{C}$$

The sensitivity drift TCG_{AV} is the G_T value divided by the temperature range. Deeper and detailed info available is our LEM technical sales offices (www.lem.com).

Offset voltage @ $I_p = 0$ A:

The offset voltage is the output voltage when the primary current is zero. The ideal value of V_o is $U_c/2$. So, the difference of $V_o - U_c/2$ is called the total offset voltage error. This offset error can be attributed to the electrical offset (due to the resolution of the ASIC quiescent voltage trimming), the magnetic offset, the thermal drift and the thermal hysteresis. Deeper and detailed info available is our LEM technical sales offices (www.lem.com).

Environmental test specifications:

Refer to LEM GROUP test plan laboratory CO.11.11.515.0 with "Tracking_Test Plan_Auto" sheet.

Insulation characteristics

Standards	
d_{ci} (Clearance distance)	> 2.6 mm (according to EN 60664: Category overvoltage OV2, Altitude correction factor for 4000 m:1.29).
d_{cp} (Creepage distance)	> 5 mm (according to EN 60664: Pollution degree PD2, inhomogeneous field, Class 1 basic insulation, <i>CTI</i> comparative tracking Index -group III a-: 200)
Dielectric rigidity	Regulation and standards:
	Test method: according to ISO 16750-2, applied voltage 2000 V AC during 1 minute Requirements: Neither dielectric breakdown nor flashover shall occur during the test.
Insulation regulation 	Regulation and standards: - ECE R100
	Requirements: Insulation resistance shall be greater than 1 Gohm. Test method according to ISO 16750-2 (test voltage 500 V during 1 minute)
