

AUTOMOTIVE CURRENT TRANSDUCER OPEN LOOP TECHNOLOGY DHAB S/161

Introduction

The DHAB family is best suited for DC, AC, or pulsed currents measurement in high power and low voltage automotive applications. It features galvanic separation between the primary circuit (high power) and the secondary circuit (electronic circuit).

The DHAB family gives you a choice of having different current measuring ranges in the same housing (from ±20 up to ±900 A).

Features

- · Open Loop transducer using the Hall effect
- Low voltage application
- Unipolar +5 V DC power supply
- Primary current measuring range up to ±100 A for channel 1 and ±800 A for channel 2
- Maximum RMS primary admissible current: defined by busbar to have T < +150 °C
- Operating temperature range: -40 °C < T < + 125 °C
- Output voltage: full ratio-metric (in sensitivity and offset).

Special feature

 Dual channel sensor for wider measurement range and redundancy.

Advantages

- Good accuracy for high and low current range
- Good linearity
- · Low thermal offset drift
- · Low thermal sensitivity drift
- Hermetic package.

Automotive applications

- Battery Pack Monitoring
- Hybrid Vehicles
- EV and Utility Vehicles.

Principle of DHAB Family

The open loop transducers uses a Hall effect integrated circuit. The magnetic flux density B, contributing to the rise of the Hall voltage, is generated by the primary current I_p to be measured.

The current to be measured $I_{\rm p}$ is supplied by a current source i.e. battery or generator (Figure 1).

Within the linear region of the hysteresis cycle, *B* is proportional to:

$$B(I_p) = a \times I_p$$

The Hall voltage is thus expressed by:

$$U_{H} = (c_{H}/d) \times I_{H} \times a \times I_{P}$$

Except for $I_{\rm p}$ all terms of this equation are constant. Therefore:

$$U_{\rm H} = b \times I_{\rm P}$$
 a constant b constant $c_{\rm H}$ Hall coefficient

 $c_{\rm H}$ Hall coefficient d thickness of the Hall plate $I_{\rm H}$ current across the Hall plates

The measurement signal $\,U_{\rm H}$ amplified to supply the user output voltage or current.

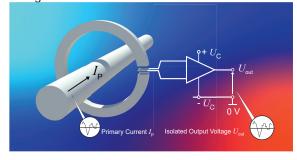

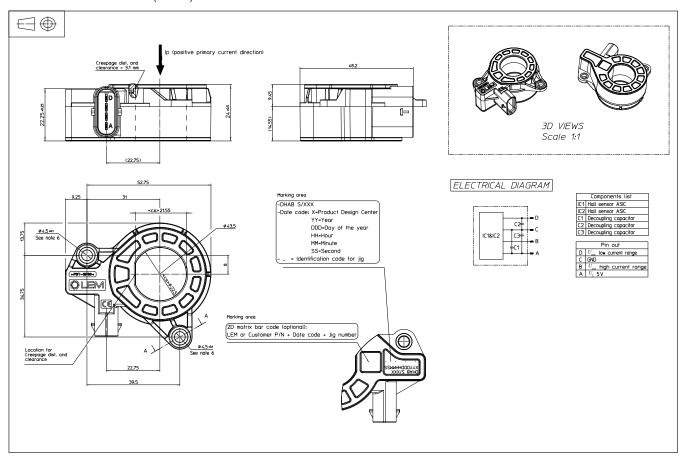

Fig. 1: Principle of the open loop transducer.

N° 52.B6.99.161.0 Page 1/7

Dimensions DHAB S/161 (in mm)

Mechanical characteristics

>PBT-GF30< Plastic case

Magnetic core Channel 1: FeNi alloy

Channel 2: FeSi alloy

Brass tin plated Electrical terminal coating

Mass 82 g.

Mounting recommendation

• Mating connector P/N TYCO 1-1456426-5 Max assembly torque 2.5 N·m (for M4 x 0.7)

Clamping force must be applied on the compression limiter

 Soldering type N/A.

Remarks

•
$$I_{P} = \left(\frac{5}{U_{C}} \times U_{\text{out}} - U_{O}\right) \times \frac{1}{S} \text{ with } S \text{ in (V/A)}$$

 $\bullet \quad U_{\rm out}$ > $U_{\rm o}$ when $I_{\rm P}$ flows in the positive direction (see arrow on drawing).

System architecture (example)

 $R_{\rm L}$ > 10 kΩ optional resistor for signal line diagnostic $C_{\rm L}$ < 100 nF EMC protection $R_{\rm C}$ Low pass filter EMC protection (optional)

Notes: 1) The output voltage U_{out} is fully ratiometric. The offset and sensitivity are dependent on the supply voltage U_{c} relative to the following formula: $I_{\text{P}} = \left(\frac{5}{U_{\text{C}}} \times U_{\text{out}} - U_{\text{O}}\right) \times \frac{1}{S} \text{ with } S \text{ in (V/A)}$

$$I_{P} = \left(\frac{5}{U} \times U_{\text{out}} - U_{\text{O}}\right) \times \frac{1}{S} \text{ with } S \text{ in (V/A)}$$

Page 3/7

²⁾ Primary current frequencies must be limited in order to avoid excessive heating of the busbar, magnetic core and the ASIC (see feature paragraph in page 1.)

PERFORMANCES PARAMETERS DEFINITIONS

Primary current definition:

Definition of typical, minimum and maximum values:

Minimum and maximum values for specified limiting and safety conditions have to be understood as such as values shown in "typical" graphs. On the other hand, measured values are part of a statistical distribution that can be specified by an interval with upper and lower limits and a probability for measured values to lie within this interval. Unless otherwise stated (e.g. "100 % tested"), the LEM definition for such intervals designated with "min" and "max" is that the probability for values of samples to lie in this interval is 99.73 %. For a normal (Gaussian) distribution, this corresponds to an interval between -3 sigma and +3 sigma. If "typical" values are not obviously mean or average values, those values are defined to delimit intervals with a probability of 68.27 %, corresponding to an interval between -sigma and +sigma for a normal distribution. Typical, minimum and maximum values are determined during the initial characterization of a product.

Output noise voltage:

The output voltage noise is the result of the noise floor of the Hall elements and the linear amplifier.

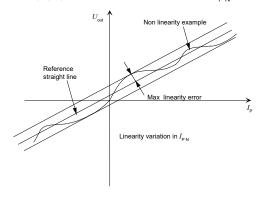

Magnetic offset:

The magnetic offset is the consequence of an any current on the primary side. It's defined after a stated excursion of primary current.

Linearity:

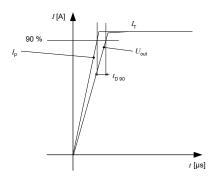

The maximum positive or negative discrepancy with a reference straight line $U_{\rm out}$ = $f(I_{\rm P})$.

Unit: linearity (%) expressed with full scale of I_{PN} .

Delay time $t_{D 90}$:

The time between the primary current signal $(I_{\rm P\ N})$ and the output signal reach at 90 % of its final value.

Sensitivity:

The transducer's sensitivity S is the slope of the straight line $U_{\rm out} = f(I_{\rm p})$, it must establish the relation:

$$U_{\text{out}}(I_{\text{P}}) = U_{\text{C}}/5 (S \times I_{\text{P}} + U_{\text{O}})$$

Offset with temperature:

The error of the offset in the operating temperature is the variation of the offset in the temperature considered with the initial offset at 25 $^{\circ}$ C.

The offset variation $I_{\rm O\,\it T}$ is a maximum variation the offset in the temperature range:

$$I_{\text{O}T} = I_{\text{O}E} \max - I_{\text{O}E} \min$$

The offset drift $TCI_{\text{O E AV}}$ is the $I_{\text{O T}}$ value divided by the temperature range.

Sensitivity with temperature:

The error of the sensitivity in the operating temperature is the relative variation of sensitivity with the temperature considered with the initial offset at $25\,^{\circ}$ C.

The sensitivity variation S_T is the maximum variation (in ppm or %) of the sensitivity in the temperature range: S_T = (Sensitivity max – Sensitivity min) / Sensitivity at 25 °C. The sensitivity drift TCS_{AV} is the S_T value divided by the temperature range. Deeper and detailed info available is our LEM technical sales offices (www.lem.com).

Offset voltage @ $I_p = 0$ A:

The offset voltage is the output voltage when the primary current is zero. The ideal value of $U_{\rm O}$ is $U_{\rm C}/2$. So, the difference of $U_{\rm O}$ – $U_{\rm C}/2$ is called the total offset voltage error. This offset error can be attributed to the electrical offset (due to the resolution of the ASIC quiescent voltage trimming), the magnetic offset, the thermal drift and the thermal hysteresis. Deeper and detailed info available is our LEM technical sales offices (www.lem. com).

Environmental test specifications:

Refer to LEM GROUP test plan laboratory CO.11.11.515.0 with "Tracking_Test Plan_Auto" sheet.
