

## General Description

The LTA77 is a 44-V micro-power alternative to the industry-standard OP77/OP07 precision amplifiers. The LTA77 offer outstanding dc precision and ac performance, including 25  $\mu\text{V}$  ultralow offset, below 0.3  $\mu\text{V}/^\circ\text{C}$  drift over temperature, 0.5  $\mu\text{V}_{\text{p-p}}$  input voltage noise and 0.9 MHz bandwidth. External offset trimming is not required in the majority of circuits.

A PSRR of 3  $\mu\text{V}/\text{V}$  (110 dB) and CMRR of 1.0  $\mu\text{V}/\text{V}$  (120 dB) maximum virtually eliminate errors caused by power supply drifts and common-mode signals. This combination of outstanding characteristics makes the LTA77 ideally suited for high resolution instrumentation and other tight error budget systems.

The robust design of the LTA77 provides ease-of-use to the circuit designer: integrated RF/EMI rejection filter, no phase reversal in overdrive conditions, and high electro-static discharge (ESD) protection. The LTA77 is optimized for operation at voltages from +6 V ( $\pm 3$  V) to +44 V ( $\pm 22$  V) over the extended temperature range of  $-40^\circ\text{C}$  to  $+125^\circ\text{C}$ .
