

General Description

The LTA4580 device is a dual operational amplifier that has been designed optimally for audio applications, such as improving tone control.

The LTA4580 device offers low noise, high gain bandwidth, low harmonic distortion, and high output current, all of which make the device ideally suited for audio electronics, such as preamplifiers, active filters, and professional audio mixers. When high output current is required, this device can be used as a headphone amplifier.

The LTA4580 device is improved to rail-to-rail output swing and an input common mode range that includes the $-V_S$ rail. Due to its wide operating supply voltage, this device can also be used in low-voltage applications.

The LTA4584 device is an additional supply of quad audio operational amplifier that features same performance. This device offers in 14-pin industry-standard configuration for obtaining the space and cost savings.

Pin Description

Symbol	Description
-IN	Inverting input of the amplifier. The voltage range is from V_{S-} to $V_{S+} - 2V$.
+IN	Non-inverting input of the amplifier. This pin has the same voltage range as -IN.
+ V_S	Positive power supply. The voltage is from 4V to 48V. Split supplies are possible as long as the voltage between V_{S+} and V_{S-} is from 4V to 48V.
- V_S	Negative power supply. It is normally tied to ground. It can also be tied to a voltage other than ground as long as the voltage between V_{S+} and V_{S-} is from 4V to 48V.
