

Magnetic Angle Position Sensor

Features and Benefits

- Based on advanced AMR Sensing Technology with 0°~360° Full Range Angle Sensing
- Contactless Angle Measurement
- Independent Output Interface: I²C, SPI, Analog and PWM
- Programmable Linear Transfer Characteristic
- Programmable Zero Position
- 14 bit Core Resolution
- 12 bit DAC/PWM Resolution
- User Programmable Resolution & Zero Position
- RoHS Compliant 2011/65/EU
- SOP-8 or QFN-16 Package

Applications

- Absolute Linear Position Sensor
- BLDC Motor Control
- Robotics Control
- Contactless Potentiometer
- Power Tools

General Description

The MagnTek rotary position sensor MT6813 is an IC based on advanced AMR magnetic sensing technology. The sensor contains two Wheatstone bridges formed by a magnet field sensing element array. A rotating magnetic field in the x-y sensor plane delivers two sinusoidal output signals indicating the angle (α) between the sensor and the magnetic field direction. Within a homogeneous field in the x-y plane, the output signals are relatively independent of the physical placement in the z direction.

The sensor is only sensitive to the magnetic field direction as the sensing element output is specially designed to be independent from the magnet field strength. This allows the device to be less sensitive to magnet variations, stray magnetic fields, air gap changes and off-axis misalignment.

A standard I²C or SPI (3-Wire or 4-Wire) interface allows a host microcontroller to read the 14-bit absolute angle position data from MT6813.

The absolute angle position is also provided as PWM output or linear analog signal proportional to VDD from a 12 bit DAC.

2. Functional Diagram

The MT6813 is manufactured in a CMOS standard process and uses advanced magnet sensing technology to sense the magnetic field distribution across the surface of the chip. The integrated magnetic sensing element array is placed around the center of the device and delivers a voltage representation of the magnetic field at the surface of the IC.

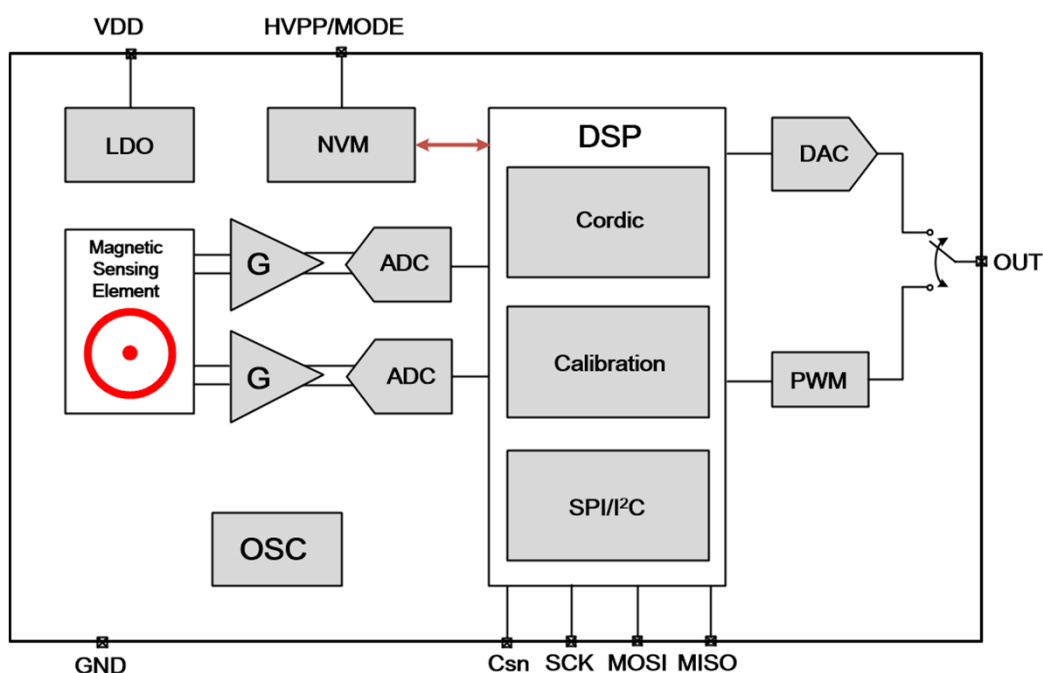

Figure 3: Block Diagram

Figure 3 shows a simplified block diagram of the chip, consisting of the magnetic sensing element modeled by two interleaved Wheatstone bridges to generate cosine and sine signals, gain stages, analog-to-digital converters (ADC) for signal conditioning, and a digital signal processing (DSP) unit. Other supporting blocks such as LDO, etc. are also included.

3. Absolute Maximum Ratings (Non-Operating)

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only. Functional operation of the device at these or any other conditions beyond those indicated under "Operating Conditions" is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Note (1): The typical error value can be achieved at room temperature and with no off-axis misalignment error. The maximum error value can be achieved over operation temperature range, at maximum air gap and with worst-case off-axis misalignment error.

Note (2): The analog output is by design ratiometric, i.e. it is proportional to the supply voltage VDD. The ratiometric error is calculated as follows.

$$E_{rm} = \left[\frac{V_{out}(V_{DD})}{V_{nn}} - \frac{V_{out}(5V)}{5V} \right] \cdot 100\%$$

6. Output Mode

The MT6813 provides Analog and PWM at output pin, also angle position data could be transferred by I²C or SPI interface.

6.1 I/O Pin Configuration

For SOP-8 package, I²C and SPI are configured to Pin.5, Pin.6 and Pin.7. Analog and PWM output is configured to Pin.3.

6.4.2 I²C Read Angle Registers

The slave ID of MT6813 is b' 0000110 in 7 bit binary form. The 14 bits angle data is stored in internal register 0x03 and 0x04. Please follow the I²C timing of Figure 12 to read the angle data from 0x03 and 0x04 registers.

Note: Please read Register 0x03 first and then read 0x04

0~360° absolute angle θ could be calculated by the below formula:

$$\theta = \frac{\sum_{i=0}^{13} \text{Angle} \langle i \rangle \cdot 2^i}{16384} \cdot 360^\circ$$

Bit 0x04[1] is a diagnosed bit for No Magnet Detected. When the MT6813 could not detect enough magnetic field for proper operation, this bit is set to high.

6.5 SPI Interface

The MT6813 also provides a 4-Wire or 3-Wire SPI (Register 3W_SPI should be programmed to 'High' to enable 3-Wire SPI Mode) interface for host MCU to read back digital absolute angle information from its internal registers. The reference circuit for SPI interface is shown in Figure 15 and Figure 16.

6.5.1 SPI Timing Diagram

The MT6813 SPI uses mode=3 (CPOL=1, CPHA=1) to exchange data. As shown in Figure 17, a data transfer starts with the falling edge of CSN. The MT6813 samples data on the rising edge of SCK, and the data transfer finally stops with the rising edge of CSN.

T_{HD}	Hold time of MOSI data	40	-	ns

Notes:

(1) The MT6813 has a burst mode. When this mode is enabled, the chip internal clock frequency is doubled and the minimum T_{SCK} also could be reduced to 200ns

(2) The MT6813 has a burst mode. When this mode is enabled, the chip internal clock frequency is doubled and the minimum T_{SCKL} and T_{SCKH} also could be reduced to 100ns

6.5.2 4-Wire SPI

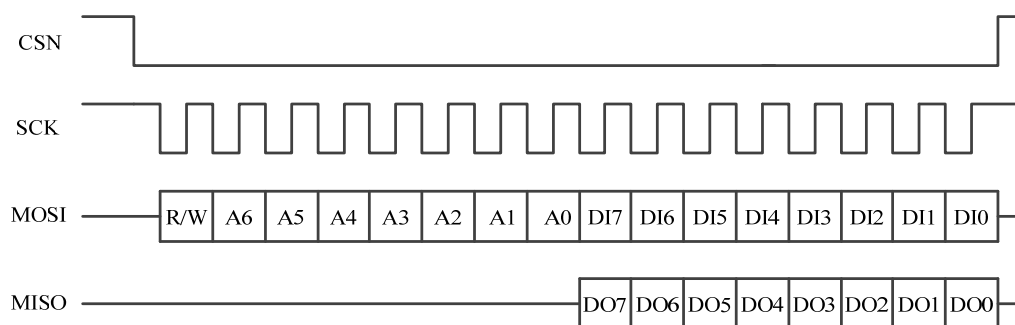

Figure 18: 4-Wire SPI Timing

An SPI data transfer starts with the falling edge of CSN and stops at the rising edge of CSN. SCK is the Serial Port Clock and it is controlled by the SPI master, it is high when there is no SPI transmission. MOSI (master output slave input) and MISO (master input slave output) is the Serial Port Data Input and Output, it is driven at the falling edge of SCK and should be captured at the rising edge of SCK.

Bit 0: R/W bit, when it is 0, the data DI7~DI0 is written into the device, when it is 1, the data DO7~DO0 from the device is read.

Bit 1-7: Address A6~A0. This is the address field of the indexed register.

Bit 8-15: Data DI7~DI0 (write mode). This is the data that will be written into the device (MSB first).

Bit 8-15: Data DO7~DO0 (read mode). This is the data that will be read from the device (MSB first).

7. Magnet Placement

It is required that the magnet's center axis be aligned with the sensing element center of MT6813 with the air-gap as small as possible. Any misalignment introduces additional angle error and big air-gap also weakens the magnet field which could be sensed by the device. Magnets with larger diameter are more tolerant to DISP (off-axis misalignment) and big AG (air-gap between Magnet and device).
