General Description

MagnTek' s rotary position sensor MT6835 is an IC based on advanced AMR technology. A rotating magnetic field in the x-y sensor plane delivers two sinusoidal output signals which indicating the angle (α) between the sensor and the magnetic field direction.

The sensor is only sensitive to the magnetic field direction in x-y plane as the sensing element output is specially designed to be independent from the magnet field strength. This allows the device to be less sensitive to magnet variations, stray magnetic fields, air gap changes and off-axis misalignment.

The incremental ABZ output mode is available in this sensor series, making the chip suitable to replace various optical encoders. The maximum resolution is 16,384 pulses or 65,536 steps per revolution

A 4-Wire SPI interface allows a host microcontroller to read out the 21-bit absolute angle position data from MT6835. The absolute angle position is also provided as a 12-bit PWM output.

2. Functional Diagram

The MT6835 is manufactured in a CMOS standard process and uses advanced magnet sensing technology to sense the magnetic field distribution across the surface of the chip. The integrated magnetic sensing element array is placed around the center of the device and delivers a voltage representation of the magnetic field at the surface of the IC.

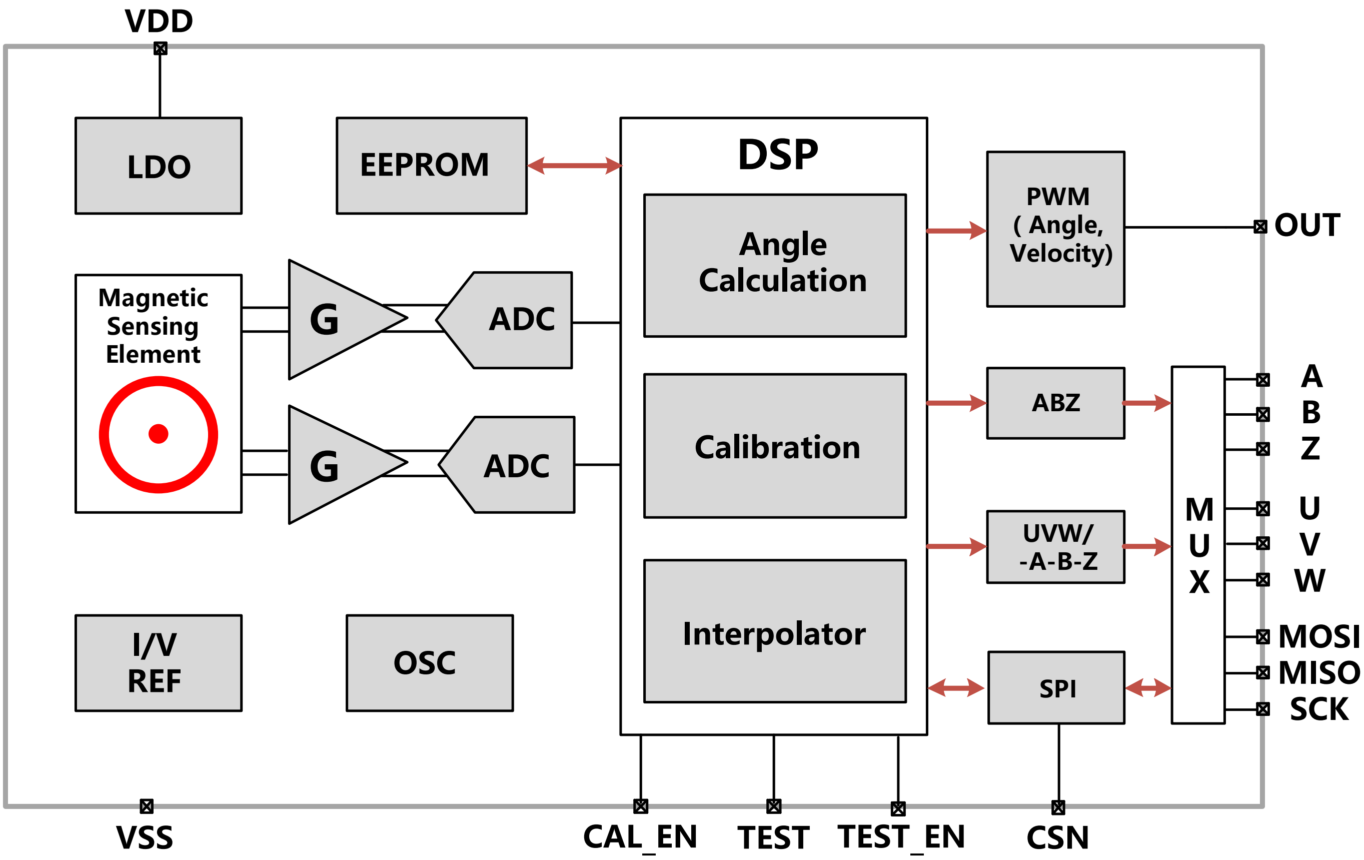

Figure 2: Block Diagram

Figure 2 shows a simplified block diagram of the chip, consisting of the magnetic sensing element modeled by two interleaved Wheatstone bridges to generate cosine and sine signals, gain stages, analog-to-digital converters (ADC) for signal conditioning, and a digital signal processing (DSP) unit for encoding. Other supporting blocks such as LDO, etc. are also included.

3. Absolute Maximum Ratings (Non-Operating)

Stresses beyond those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. These are stress ratings only. Functional operation of the device at these or any other conditions beyond those indicated under “Operating Conditions” is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

7.2 Reference Circuit

The MT6835 is powered by a single supply VDD (3.3~5.0V), so a decoupling capacitor no less than 0.1uf between VDD and GND is necessary. For better EMC performance, we highly recommend adding a TVS between VDD and GND. The default reference circuit is shown in Figure. 5.

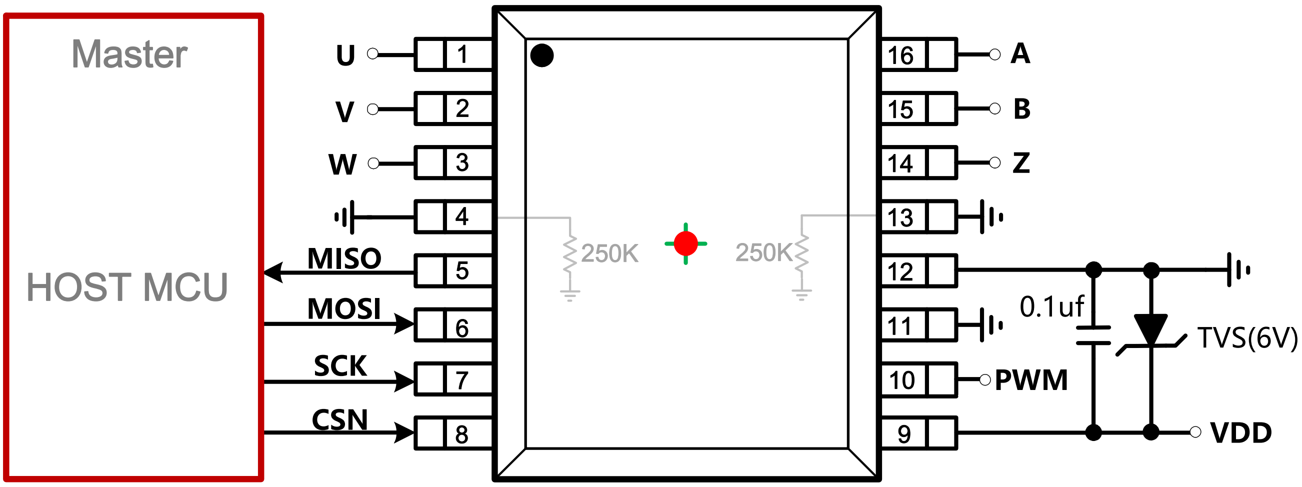

Figure 5: Reference Circuit without User Auto-Calibration

The reference circuit for User Auto-Calibration is shown in Figure. 6, the detail of User Auto-Calibration please refer to Chapter 9.2.

7.3 Quadrature A,B and Zero-Position Output (ABZ Mode)

As shown in Figure 7, when the magnet rotates counter-clock-wise (CCW), output B leads output A by 1/4 cycle, when the magnet rotates clock-wise (CW), output A leads output B by 1/4 cycle (or 1 LSB). Output Z indicates the zero position of the magnet. After chip power-on, the ABZ output is blocked for 64ms to guarantee proper output.

7.6 SPI Interface

The MT6835 also provides a 4-Wire SPI interface for a host MCU both to read back digital absolute angle information from its internal registers and to program its EEPROM.

7.6.1 SPI Reference Circuit

7.6.2 SPI Timing Diagram

The MT6835 SPI uses mode=3 (CPOL=1, CPHA=1) to exchange data. As shown in Figure 17, a data transfer starts with the falling edge of CSN. The MT6835 samples data on the rising edge of SCK, and the data transfer finally stops with the rising edge of CSN.

7.6.3 SPI Protocol

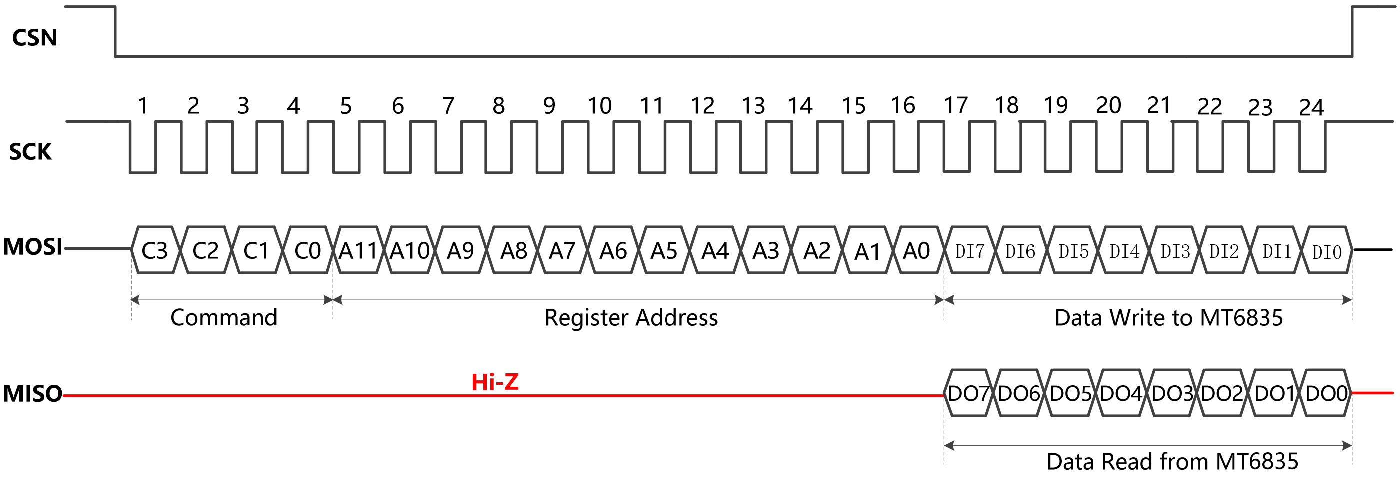

Figure 18: 4-Wire SPI Timing

An SPI data transfer starts with the falling edge of CSN and stops at the rising edge of CSN. SCK is the Serial Port Clock, and it is controlled by the SPI master, it is high when there is no SPI transmission. MOSI (master output slave input) and MISO (master input slave output) is the Serial Port Data Input and Output, it is driven at the falling edge of SCK and should be captured at the rising edge of SCK. The ‘MISO’ keeps Hi-Z unless it drives data as shown in Figure 18.

7.6.4 SPI Read One Byte Register

For single byte read, the operation command C3~C0= ‘0011’ , and the target 12-bit register address A11~A0 please refer to Chapter 10.

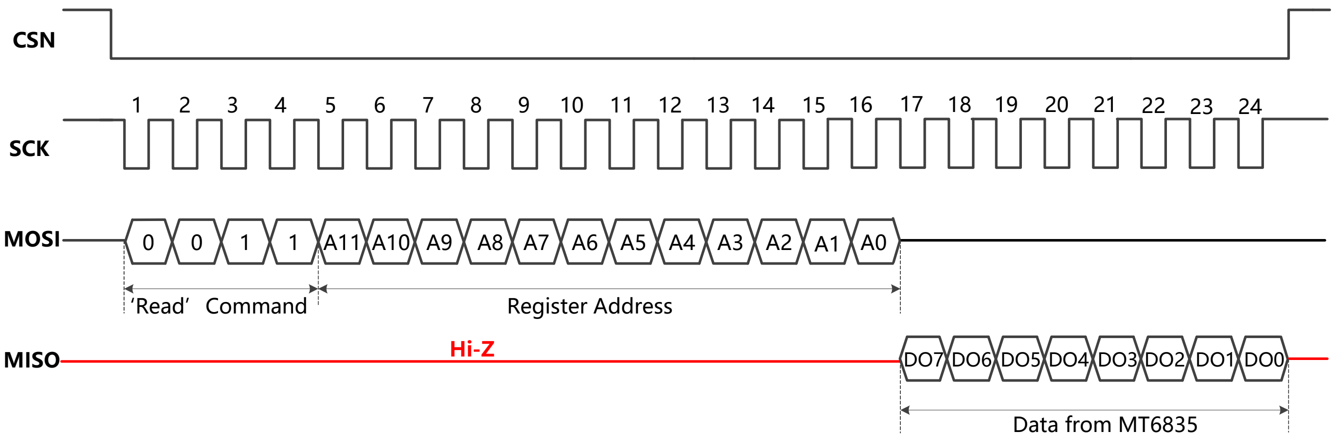

Figure 19: SPI Read One Byte Register

7.6.5 SPI Write One Byte Register

For single byte write, the operation command C3~C0= ‘0110’ , and the target 12-bit register address A11~A0 please refer to Chapter 10.

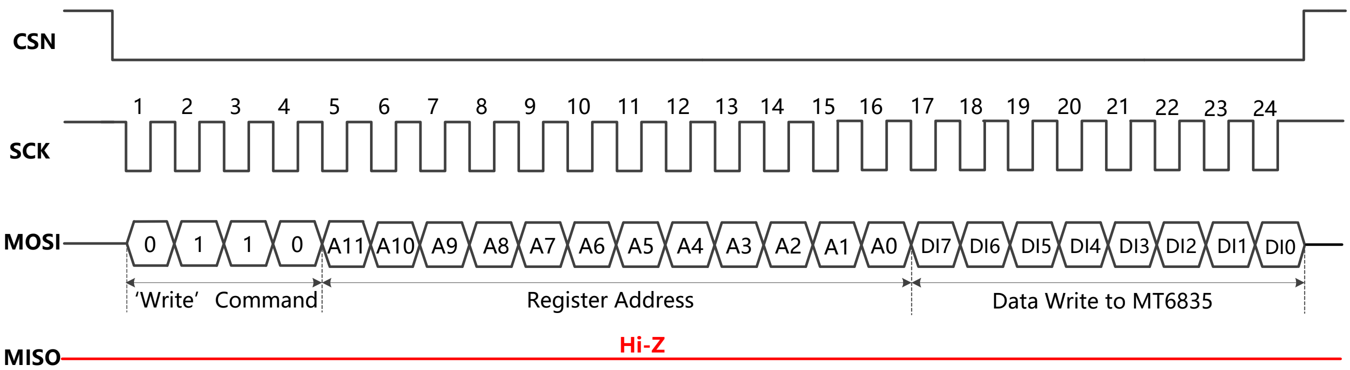

Figure 20: SPI Write One Byte Register

7.6.6 SPI Program EEPROM

For EEPROM programming, the operation command C3~C0= '1100' , and all the data in 'Register Map' will be programmed to EEPROM. When the command received successfully, the acknowledge bits ack7~ack0 will return value 0x55; any other value indicates the command received failed.

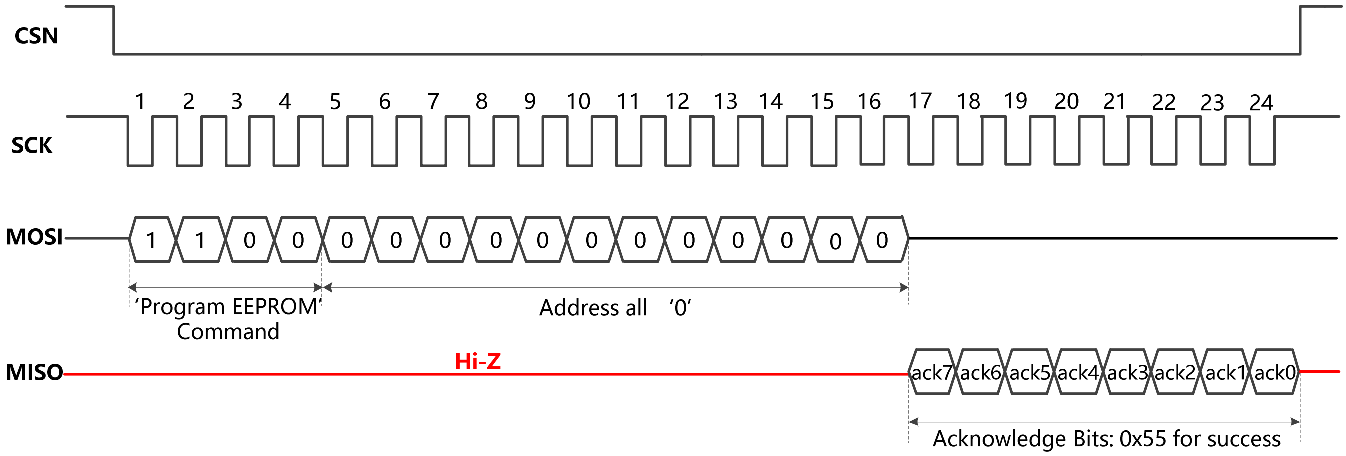

Figure 21: SPI Program EEPROM

When the data is programmed to EEPROM, they will be non-volatile; while the data in register map it is volatile, meaning it is lost when the power goes off. The user could read/write the register map through SPI interface and program the data of register map into EEPROM by SPI command.

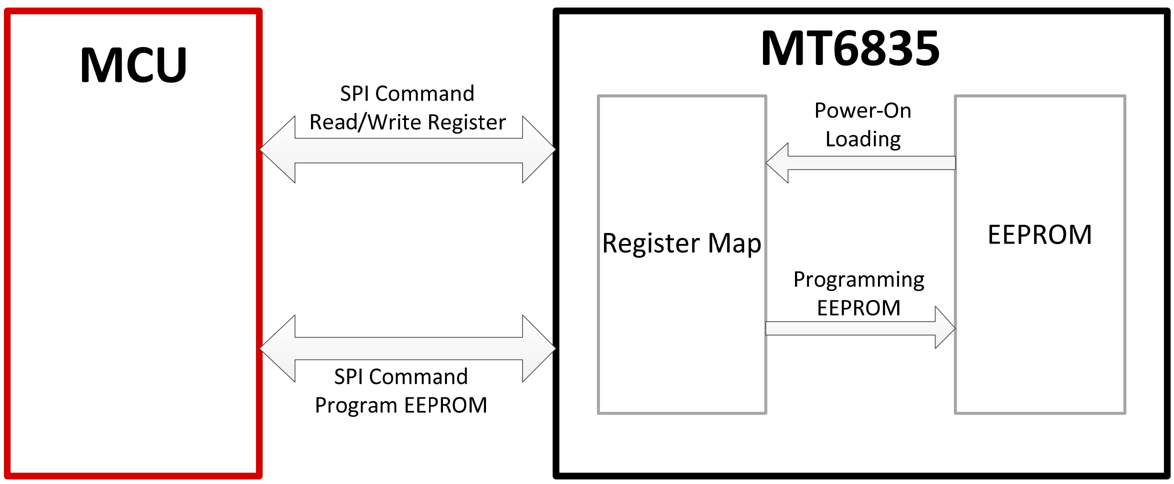

Figure 22: Register Map and EEPROM

7.6.7 SPI Auto Setting Zero Position

MT6835 provide an Auto Setting Zero Position command, which will automatically write current position as the new Zero Position to the register 'ZERO_POS[11:0]'. The operation command is C3~C0= '0101', when the command is received successfully, the acknowledge bits ack7~ack0 will return value 0x55; any other value indicates the command received failed.

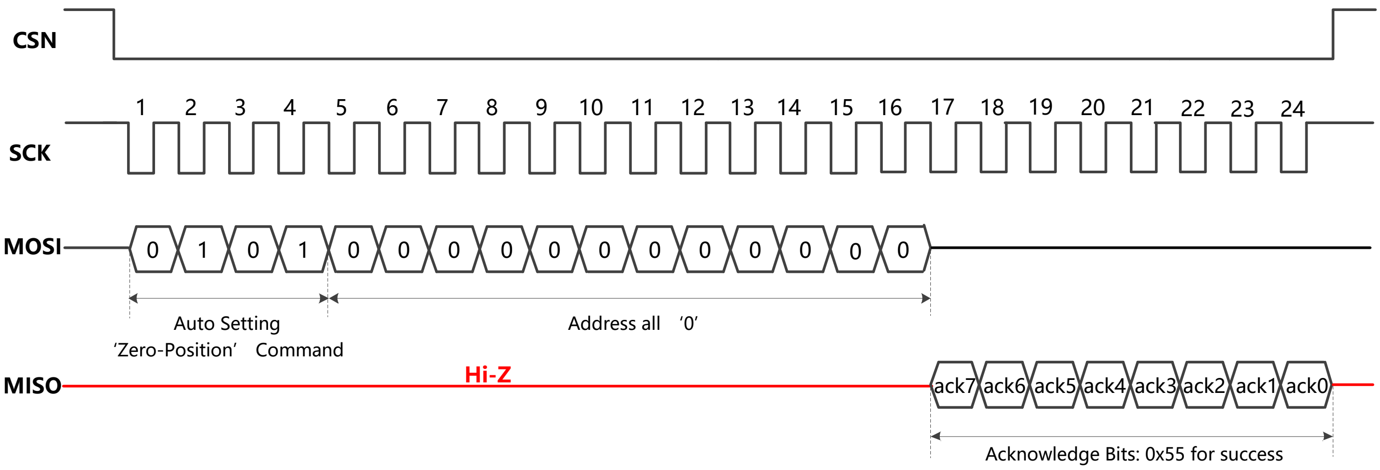

Figure 23: SPI Auto Setting Zero-Position Register

This command only stores the current position into 'ZERO_POS[11:0]' register. If the user want to program it to EEPROM, an SPI program EEPROM operation should be additionally done as shown in Figure 21.

7.6.8 SPI Single Byte Read Angle Registers

The 21-bit absolute angle data could be read by SPI interface as shown in Figure 24. In order to facilitate the user to synchronize the sampling of angle data, when CSN is pulled down, MT6835 internally latched the data of 0x003~0x006, which will not be refreshed until all 0x003~0x006 registers have been read out, or another falling edge of CSN is received.

0~360° absolute angle θ could be calculated by the below formula with ANGLE[20:0]:

$$\theta = \frac{\sum_{i=0}^{20} \text{ANGLE} < i > \bullet 2^{i}}{2^{21}} \bullet 360°$$

CRC Data Range: ANGLE[20:0] and STATUS[2:0] total 24bits

CRC polynomials: X^8+X^2+X+1, MSB (ANGLE[20]) shifts in first.

7.6.9 SPI Burst Read Angle Registers

The MT6835 provides an SPI burst read angle registers mode for faster data transfer than single byte read mode as shown in Figure 25. The operation command of this mode is C3~C0= '1010' , after MCU sends this command with address 0x003, MT6835 continuously outputs angle data of register 0x003~0x006.

In order to facilitate the user to synchronize the sampling of angle data, when CSN is pulled down, MT6835 internally latches the data of 0x003~0x006, which will not be refreshed until all 0x003~0x006 registers have been read out, or another falling edge of CSN is received.

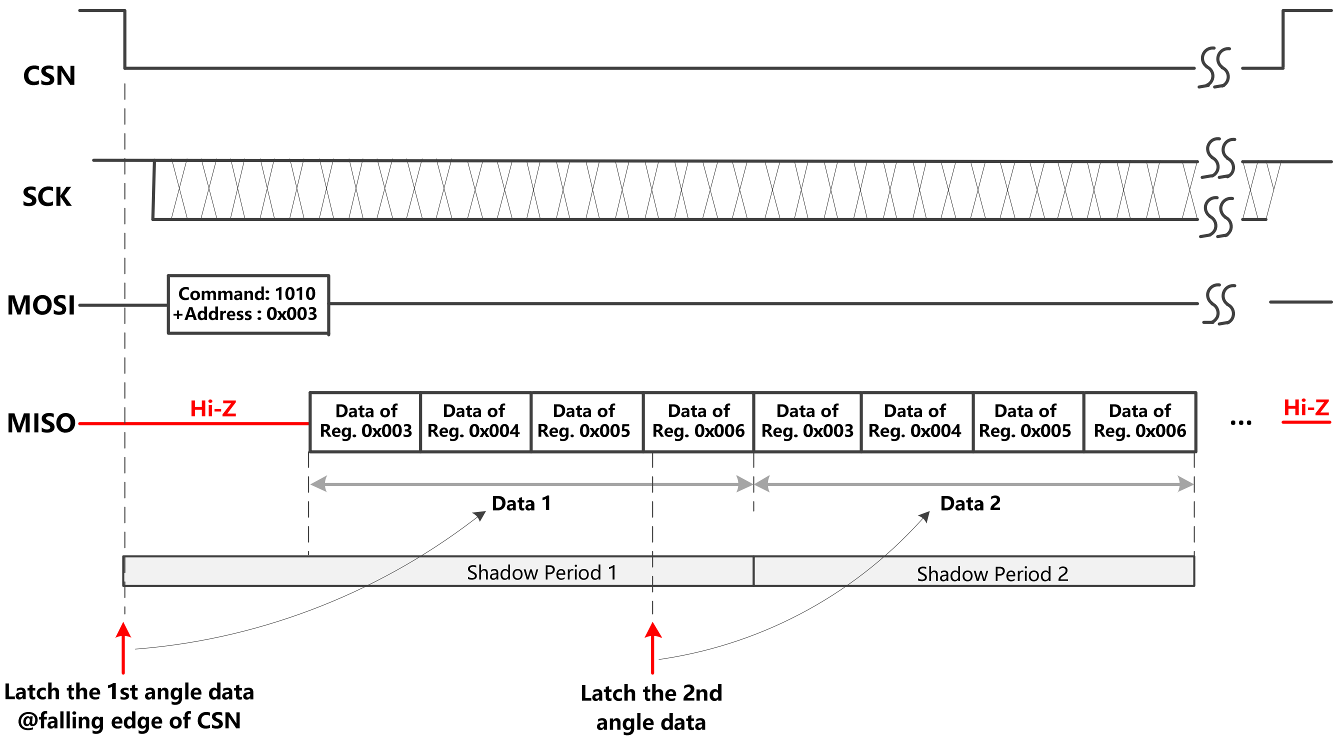

Figure 25: SPI Burst Read Angle Registers

8. Change & Program Zero-Position to EEPROM

'ZERO_POS[11:0]' register defines the zero degree of MT6835, the default zero degree of MT6835 with a two-pole magnet is shown in Chapter 12. There are two methods to change the register 'ZERO_POS[11:0]' as shown in Figure 26.

Address	Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0	Type
0x009	ZERO_POS[11:4]								EEPROM
0x00A	ZERO_POS[3:0]				Z_EDGE	Z_PUL_WID[2:0]			EEPROM

(1) Auto Setting by SPI with '*Auto Setting Zero-Position*' Command

This method can only change the zero-position to current mechanical position.

(2) Manual Calculate Zero Degree and Write Register by SPI

(a) Write data 0x000 to register 'ZERO_POS[11:0]' by SPI;

(b) Read out the angle data of current position by SPI;

(c) Calculate the target Zero-Position value, write it to 'ZERO_POS[11:0]' by SPI;

For both auto and manual methods, an extra SPI '***Program EEPROM***' operation is necessary for storing the new zero-position value into EEPROM.

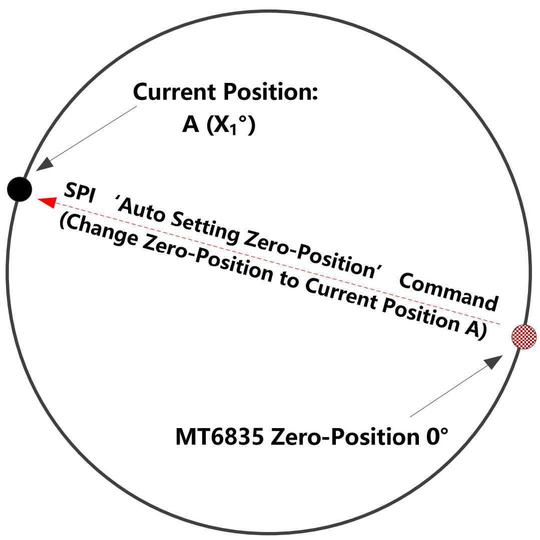

Figure 26-1: Auto Setting

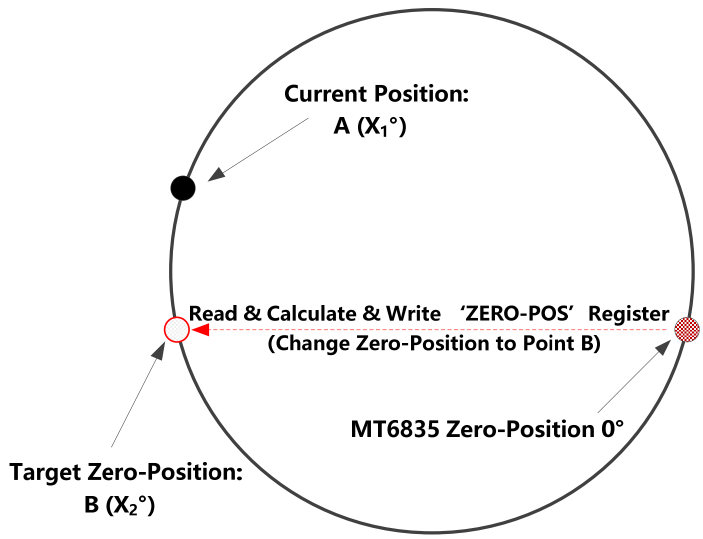

Figure 26-2: Manual Change

9. Calibration

Three calibration levels are designed in MT6835: the first level of Factory Calibration is done by MagnTek before the chip is delivered to the user; The second level of User Auto-Calibration could be optionally done by the user at a constant rotation speed; The third level User NLC Calibration could be optionally done by the user with SPI interface and external precision angle reference such as a precision optical encoder.

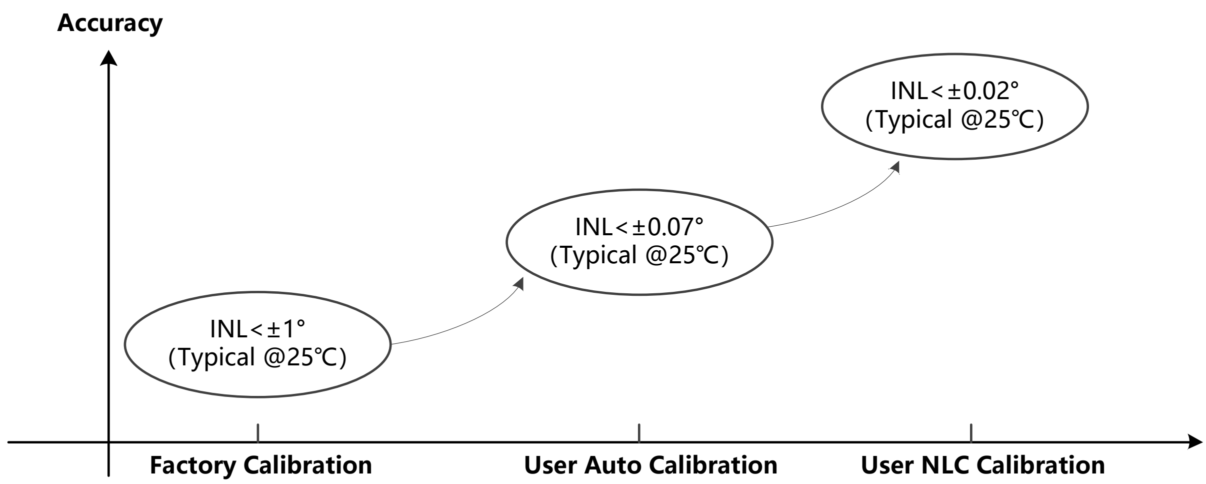

Figure 27: Three Calibration Levels

9.1 Factory Calibration

MT6835 is factory calibrated before it is delivered to the user. The original offset, gain-mismatch and phase-error of sine/cosine signals are calibrated by FT testing as shown in Figure 28, thus the INL could be reduced to less than ±0.5° (typical case).

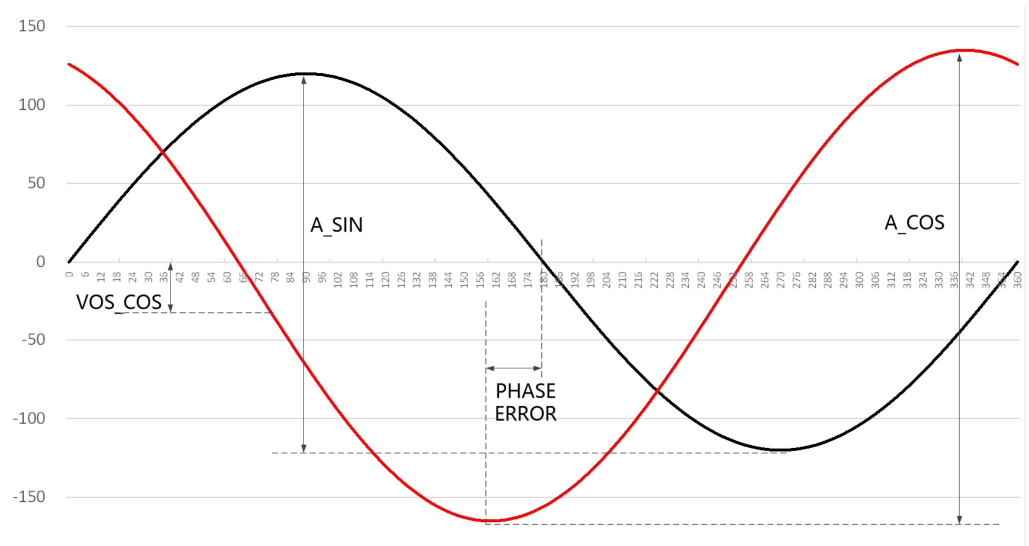

Figure 28: Offset, Gain-Mismatch and Phase-Error

9.2 User Auto-Calibration

User Auto-Calibration allows the user to configure MT6835 to fit with a specific magnetic field and assembling condition in an application system. Pulling up Pin.4 (CAL_EN) to VDD will enable this calibration, let the motor rotate at a constant speed, then the DSP of MT6835 will automatically calculate compensation coefficients compensate the calibration process. Typically, INL will be reduced to less than ±0.07° when User Auto-Calibration has been done successfully.

The operation steps:

(1) Setting the rotation speed register for User Auto-Calibration;

User Auto-Calibration Rotation Speed Register (EEPROM)

Reg. AUTOCAL_FREQ[2:0]	Description (Rotation Speed: RPM)
0x0	3200≤Speed<6400
0x1	1600≤Speed<3200
0x2	800≤Speed<1600
0x3	400 ≤Speed< 800
0x4	200≤Speed<400
0x5	100≤Speed<200
0x6	50≤Speed<100
0x7	25≤Speed<50

(2) Rotating the system at a constant speed with the present range;

(3) Pull up CAL_EN (Pin.4) to VDD to start User Auto-Calibration. Keep the system rotating at the set speed for more than 64 rounds. Monitor PWM (Pin.10) Output (When Pin.4 tied to VDD, Pin.10 is also configured as calibration status output).

PWM Output Duty-Cycle	Description
50%	Running Auto Calibration
25%	Calibration Failed
>99%	Calibration Successful

The calibration status also could be read from register 0x113[7:6]:

0x113[7:6]=00, No Calibration ; 0x113[7:6]=01, Running Calibration;

0x113[7:6]=10, Calibration Failed; 0x113[7:6]=11, Calibration Successful;

(4) If calibration has failed, please check the system and then re-calibration again.

9.3 User NLC Calibration

The User NLC (Non-Linearity Compensation) Calibration of MT6835 provides a 256-point look-up table for further INL improvement as shown in Figure 29. A possible calibration system is shown in Figure 30, a high precision optical encoder (≥20-bit) is needed to provide the ideal angle reference when doing the User NLC Calibration.

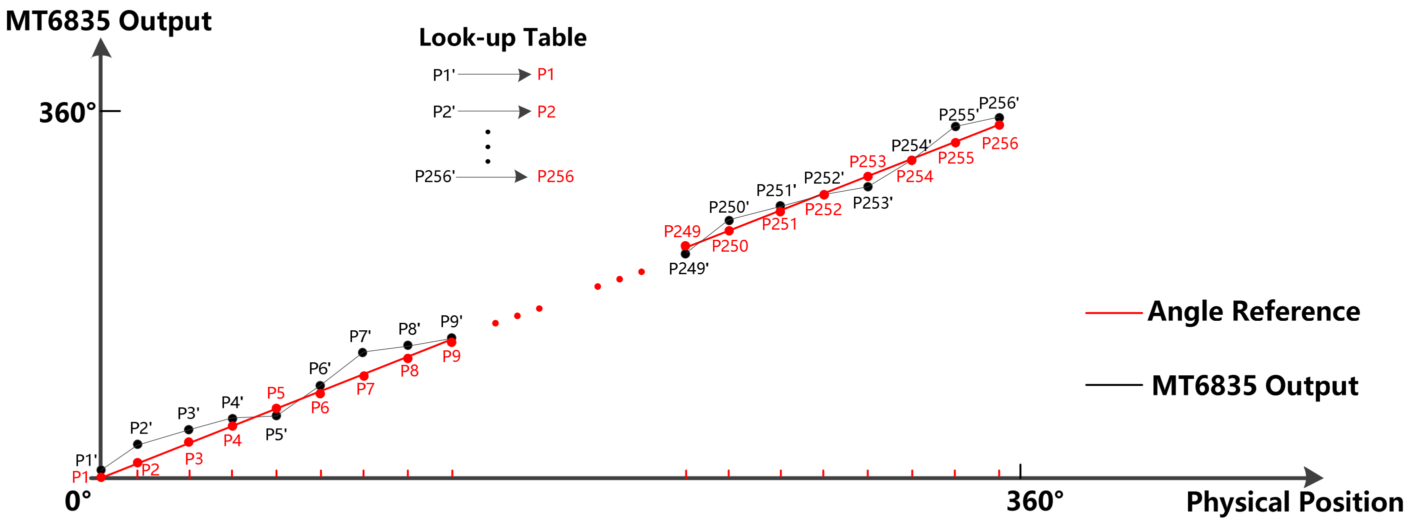

Figure 29: User NLC Calibration

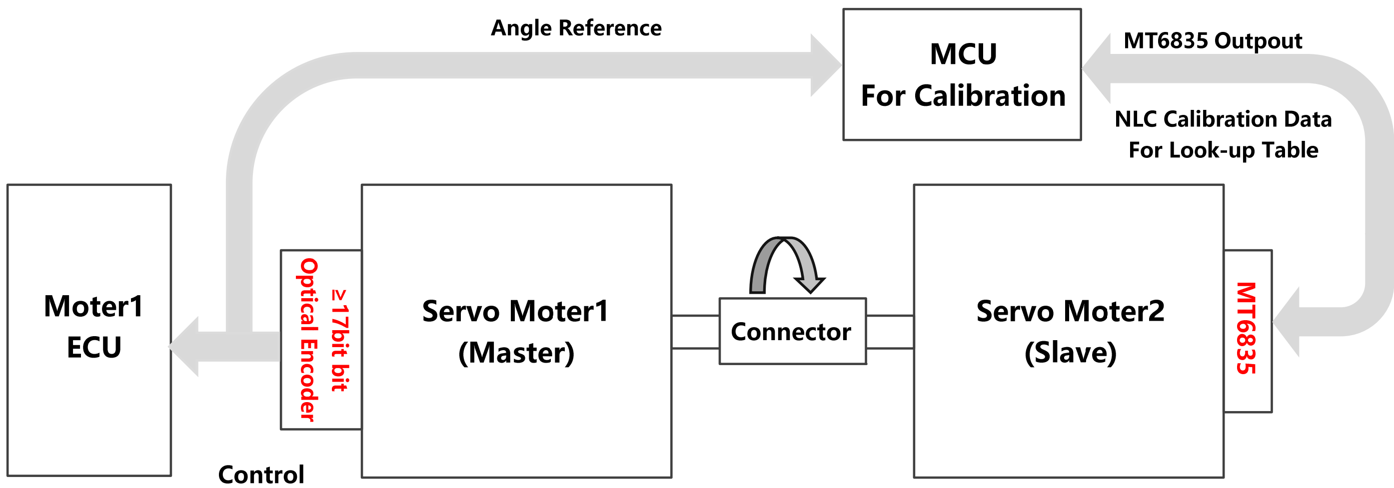

Figure 30: Possible User NLC Calibration System

If necessary, MagnTek could provide the reference code for User NLC Calibration to the user.

11. Magnet Placement

It is required that the magnet’s center axis be aligned with the sensing element center of MT6835 with the air-gap as small as possible. Any misalignment introduces additional angle error and big air-gap also weakens the magnet field which could be sensed by the device. Magnets with larger diameter are more tolerant to DISP (off-axis misalignment) and big AG (air-gap between Magnet and device).
