

SPI Serial EEPROM 8 Kbits (1,024 x 8) and 16 Kbits (2,048 x 8)

Features

- Serial Peripheral Interface (SPI) Compatible
- Supports SPI Modes 0 (0,0) and 3 (1,1):
 - Data sheet describes mode 0 operation
- Low-Voltage Operation:
 - 1.8V (V_{CC} = 1.8V to 5.5V)
- Industrial Temperature Range: -40°C to +85°C
- 20 MHz Clock Rate (5V)
- 32-Byte Page Mode
- Block Write Protection:
 - Protect 1/4, 1/2 or entire array
- Write-Protect (WP) Pin and Write Disable Instructions for Both Hardware and Software Data Protection
- Self-Timed Write Cycle within 5 ms Maximum
- High Reliability:
 - Endurance: 1,000,000 write cycles
 - Data retention: 100 years
- · Green (Lead-free/Halide-free/RoHS Compliant) Package Options
- Die Sale Options: Wafer Form and Bumped Wafers

Packages

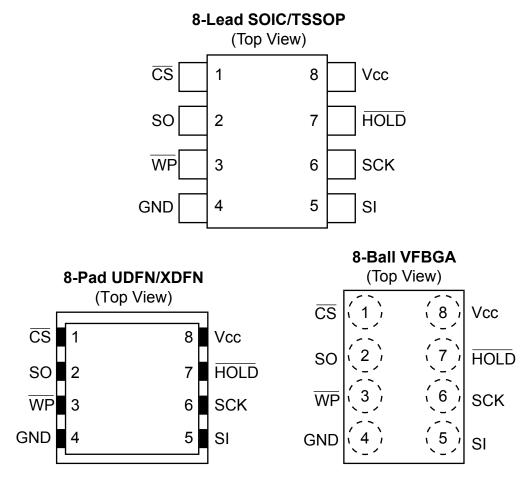

• 8-Lead SOIC, 8-Lead TSSOP, 8-Pad UDFN, 8-Pad XDFN and 8-Ball VFBGA

2. Pin Description

The descriptions of the pins are listed in Table 2-1.

Table 2-1. Pin Function Table

Name	8-Lead SOIC	8-Lead TSSOP	8-Pad UDFN ⁽¹⁾	8-Pad XDFN	8-Ball VFBGA	Function
CS	1	1	1	1	1	Chip Select
SO	2	2	2	2	2	Serial Data Output
WP ⁽²⁾	3	3	3	3	3	Write-Protect
GND	4	4	4	4	4	Ground
SI	5	5	5	5	5	Serial Data Input
SCK	6	6	6	6	6	Serial Data Clock
HOLD ⁽²⁾	7	7	7	7	7	Suspends Serial Input
Vcc	8	8	8	8	8	Device Power Supply

Note:

- 1. The exposed pad on this package can be connected to GND or left floating.
- 2. The Write-Protect (WP) and Hold (HOLD) pins should be driven high or low as appropriate.

2.1 Chip Select (CS)

The AT25080B/AT25160B is selected when the Chip Select (\overline{CS}) pin is low. When the device is not selected, data will not be accepted via the Serial Data Input (SI) pin, and the Serial Output (SO) pin will remain in a high-impedance state.

To ensure robust operation, the \overline{CS} pin should follow V_{CC} upon power-up. It is therefore recommended to connect \overline{CS} to V_{CC} using a pull-up resistor (less than or equal to 10 k Ω). After power-up, a low level on \overline{CS} is required prior to any sequence being initiated.

2.2 Serial Data Output (SO)

The Serial Data Output (SO) pin is used to transfer data out of the AT25080B/AT25160B. During a read sequence, data is shifted out on this pin after the falling edge of the Serial Data Clock (SCK).

2.3 Write-Protect (WP)

The Write-Protect (\overline{WP}) pin will allow normal read/write operations when held high. When the \overline{WP} pin is brought low and the WPEN bit is set to a logic '1', all write operations to the STATUS register are inhibited. \overline{WP} going low while \overline{CS} is still low will interrupt a write operation to the STATUS register. If the internal write cycle has already been initiated, \overline{WP} going low will have no effect on any write operation to the STATUS register. The \overline{WP} pin function is blocked when the WPEN bit in the STATUS register is set to a logic '0'. This will allow the user to install the AT25080B/AT25160B in a system with the \overline{WP} pin tied to ground and still be able to write to the STATUS register. All \overline{WP} pin functions are enabled when the WPEN bit is set to a logic '1'.

2.4 Ground (GND)

The ground reference for the Device Power Supply (V_{CC}). The Ground (GND) pin should be connected to the system ground.

2.5 Serial Data Input (SI)

The Serial Data Input (SI) pin is used to transfer data into the device. It receives instructions, addresses and data. Data is latched on the rising edge of the Serial Data Clock (SCK).

2.6 Serial Data Clock (SCK)

The Serial Data Clock (SCK) pin is used to synchronize the communication between a master and the AT25080B/ AT25160B. Instructions, addresses or data present on the Serial Data Input (SI) pin is latched in on the rising edge of SCK, while output on the Serial Data Output (SO) pin is clocked out on the falling edge of SCK.

2.7 Suspend Serial Input (HOLD)

The Suspend Serial Input (\overline{HOLD}) pin is used in conjunction with the Chip Select (\overline{CS}) pin to pause the AT25080B/ AT25160B. When the device is selected and a serial sequence is underway, \overline{HOLD} can be used to pause the serial communication with the master device without resetting the serial sequence. To pause, the \overline{HOLD} pin must be brought low while the Serial Data Clock (SCK) pin is low. To resume serial communication, the \overline{HOLD} pin is brought high while the SCK pin is low (SCK may still toggle during \overline{HOLD}). Inputs to the Serial Data Input (SI) pin will be ignored while the Serial Data Output (SO) pin will be in the high-impedance state.

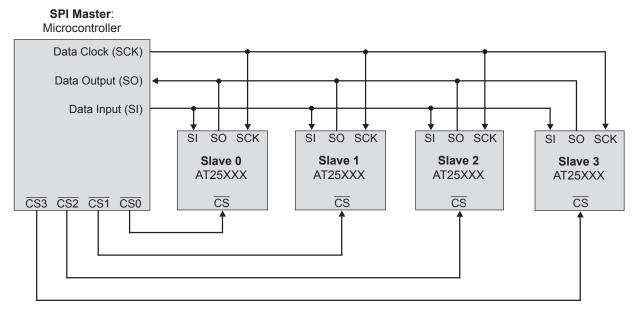

2.8 Device Power Supply (V_{CC})

The Device Power Supply (V_{CC}) pin is used to supply the source voltage to the device. Operations at invalid V_{CC} voltages may produce spurious results and should not be attempted.

3. Description

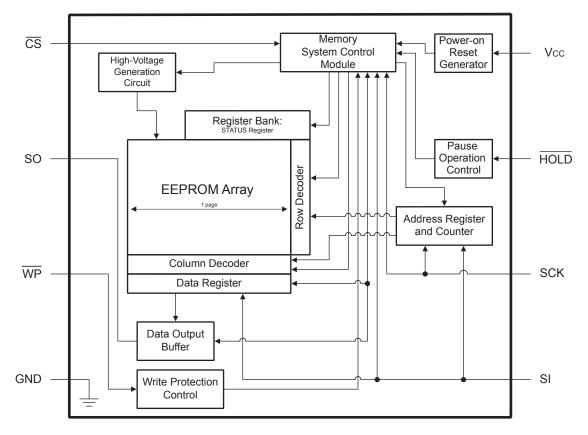

The AT25080B/AT25160B provides 8,192/16,384 bits of Serial Electrically Erasable and Programmable Read-Only Memory (EEPROM) organized as 1,024/2,048 words of 8 bits each. The device is optimized for use in many industrial and commercial applications where low-power and low-voltage operation are essential. The device is available in space-saving 8-lead SOIC, 8-lead TSSOP, 8-pad UDFN, 8-pad XDFN and 8-ball VFBGA packages. All packages operate from 1.8V to 5.5V.

4. Electrical Characteristics

4.1 Absolute Maximum Ratings

Operating temperature	-55°C to +125°C
Storage temperature	-65°C to +150°C
Voltage on any pin with respect to ground	-1.0V to +7.0V
V _{cc}	6.25V
DC output current	5.0 mA
ESD protection	> 2 kV

Note: Stresses above those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operation listings of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

4.2 DC and AC Operating Range

Table 4-1. DC and AC Operating Range

AT25080B/AT25160B

Note:

1. Applicable over recommended operating range from $T_A = -40^{\circ}C$ to $+85^{\circ}C$, $V_{CC} = As$ Specified, $C_L = 1$ TTL Gate and 30 pF (unless otherwise noted).

4.5 SPI Synchronous Data Timimg

4.6 Electrical Specifications

4.6.1 Power-Up Requirements and Reset Behavior

During a power-up sequence, the V_{CC} supplied to the AT25080B/AT25160B should monotonically rise from GND to the minimum V_{CC} level, as specified in Table 4-1, with a slew rate no faster than 0.1 V/ μ s.

4.6.1.1 Device Reset

To prevent inadvertent write operations or any other spurious events from occurring during a power-up sequence, the AT25080B/AT25160B includes a Power-on Reset (POR) circuit. Upon power-up, the device will not respond to any instructions until the V_{CC} level crosses the internal voltage threshold (V_{POR}) that brings the device out of Reset and into Standby mode.

Electrical Characteristics

The system designer must ensure the instructions are not sent to the device until the V_{CC} supply has reached a stable value greater than or equal to the minimum V_{CC} level. Additionally, once the V_{CC} is greater than or equal to the minimum V_{CC} level, the bus master must wait at least t_{PUP} before sending the first instruction to the device. See Table 4-4 for the values associated with these power-up parameters.

Table 4-4. Power-Up Conditions⁽¹⁾

Symbol	Parameter	Min.	Max.	Units
t _{PUP}	Time required after V_{CC} is stable before the device can accept instructions	100	_	μs
V _{POR}	Power-on Reset Threshold Voltage	_	1.5	V
t _{POFF}	Minimum time at V_{CC} = 0V between power cycles	0.03	—	ms

Note:

1. These parameters are characterized but they are not 100% tested in production.

If an event occurs in the system where the V_{CC} level supplied to the AT25080B/AT25160B drops below the maximum V_{POR} level specified, it is recommended that a full-power cycle sequence be performed by first driving the V_{CC} pin to GND in less than 1 ms, waiting at least the minimum t_{POFF} time and then performing a new power-up sequence in compliance with the requirements defined in this section.

4.6.2 Pin Capacitance

Table 4-5. Pin Capacitance^(1,2)

Symbol	Test Condition	Max.	Units	Conditions
C _{OUT}	Output Capacitance (SO)	8	pF	V _{OUT} = 0V
C _{IN}	Input Capacitance (CS, SCK, SI, WP, HOLD)	6	pF	V _{IN} = 0V

Note:

- 1. This parameter is characterized but is not 100% tested in production.
- 2. Applicable over recommended operating range from: $T_A = 25^{\circ}C$, $f_{SCK} = 1.0$ MHz, $V_{CC} = 5.0V$ (unless otherwise noted).

4.6.3 EEPROM Cell Performance Characteristics

Table 4-6. EEPROM Cell Performance Characteristics

Operation	Test Condition	Min.	Max.	Units
Write Endurance ⁽¹⁾	$T_A = 25^{\circ}C$, $V_{CC} = 3.3V$, Page Write mode	1,000,000	—	Write Cycles
Data Retention ⁽¹⁾	T _A = 55°C	100	_	Years

Note:

1. Performance is determined through characterization and the qualification process.

4.6.4 Software Reset

The SPI interface of the AT25080B/AT25160B can be reset by toggling the \overline{CS} input. If the \overline{CS} line is already in the active state, it must complete a transition from the inactive state ($\geq V_{IH}$) to the active state ($\leq V_{IL}$) and then back to the inactive state ($\geq V_{IH}$) without sending clocks on the SCK line. Upon completion of this sequence, the device will be ready to receive a new opcode on the SI line.

4.6.5 Device Default State at Power-Up

The AT25080B/AT25160B default state upon power-up consists of:

Standby Power mode

Electrical Characteristics

- A high-to-low-level transition on \overline{CS} is required to enter active state
- Write Enable Latch (WEL) bit in the STATUS register = 0
- Ready/Busy bit in the STATUS register = 0, indicating the device is ready to accept a new command
- Device is not selected
- Not in Hold condition
- WPEN, BP1 and BP0 bits in the STATUS register are unchanged from their previous state due to the fact that they are nonvolatile values

4.6.6 Device Default Condition

The AT25080B/AT25160B is shipped from Microchip to the customer with the EEPROM array set to an all FFh data pattern (logic '1' state). The Write-Protect Enable bit in the STATUS register is set to logic '0' and the Block Write-Protection bits in the STATUS register are set to logic '0'.

5. Device Operation

The AT25080B/AT25160B is controlled by a set of instructions that are sent from a host controller, commonly referred to as the SPI Master. The SPI Master communicates with the AT25080B/AT25160B via the SPI bus which is comprised of four signal lines: Chip Select (\overline{CS}), Serial Data Clock (SCK), Serial Data Input (SI) and Serial Data Output (SO).

The SPI protocol defines a total of four modes of operation (Mode 0, 1, 2 or 3) with each mode differing in respect to the SCK polarity and phase and how the polarity and phase control the flow of data on the SPI bus. The AT25080B/ AT25160B supports the two most common modes, SPI Modes 0 and 3. With SPI Modes 0 and 3, data is always latched in on the rising edge of SCK and always output on the falling edge of SCK. The only difference between SPI Modes 0 and 3 is the polarity of the SCK signal when in the inactive state (when the SPI Master is in Standby mode and not transferring any data). SPI Mode 0 is defined as a low SCK while \overline{CS} is not asserted (at V_{CC}) and SPI Mode 3 has SCK high in the inactive state. The SCK Idle state must match when the \overline{CS} is deasserted both before and after the communication sequence in SPI Mode 0 and 3. The figures in this document depict Mode 0 with a solid line on SCK while \overline{CS} is inactive and Mode 3 with a dotted line.

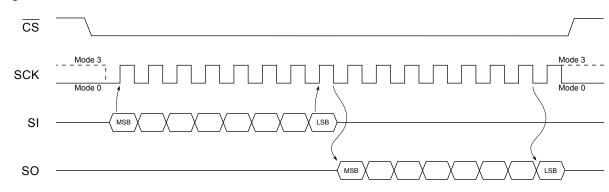

Figure 5-1. SPI Mode 0 and Mode 3

5.1 Interfacing the AT25080B/AT25160B on the SPI Bus

Communication to and from the AT25080B/AT25160B must be initiated by the SPI Master device, such as a microcontroller. The SPI Master device must generate the serial clock for the AT25080B/AT25160B on the Serial Data Clock (SCK) pin. The AT25080B/AT25160B always operates as a slave due to the fact that the SCK is always an input.

5.1.1 Selecting the Device

The AT25080B/AT25160B is selected when the Chip Select (\overline{CS}) pin is low. When the device is not selected, data will not be accepted via the Serial Data Input (SI) pin, and the Serial Data Output (SO) pin will remain in a high-impedance state.

5.1.2 Sending Data to the Device

The AT25080B/AT25160B uses the SI pin to receive information. All instructions, addresses and data input bytes are clocked into the device with the Most Significant bit (MSb) first. The SI pin samples on the first rising edge of the SCK line after the \overline{CS} has been asserted.

5.1.3 Receiving Data from the Device

Data output from the device is transmitted on the SO pin, with the MSb output first. The SO data is latched on the first falling edge of SCK after the instruction has been clocked into the device, such as the Read from Memory Array (READ) and Read STATUS Register (RDSR) instructions. See Read Sequence for more details.

5.2 Device Opcodes

5.2.1 Serial Opcode

After the device is selected by driving \overline{CS} low, the first byte will be received on the SI pin. This byte contains the opcode that defines the operation to be performed. Refer to Table 6-1 for a list of all opcodes that the AT25080B/ AT25160B will respond to.

5.2.2 Invalid Opcode

If an invalid opcode is received, no data will be shifted into AT25080B/AT25160B and the SO pin will remain in a high-impedance state until the falling edge of \overline{CS} is detected again. This will reinitialize the serial communication.

5.3 Hold Function

The Suspend Serial Input (HOLD) pin is used to pause the serial communication with the device without having to stop or reset the clock sequence. The Hold mode, however, does not have an effect on the internal write cycle. Therefore, if a write cycle is in progress, asserting the HOLD pin will not pause the operation and the write cycle will continue to completion.

The Hold mode can only be entered while the \overline{CS} pin is asserted. The Hold mode is activated by asserting the \overline{HOLD} pin during the SCK low pulse. If the \overline{HOLD} pin is asserted during the SCK high pulse, then the Hold mode will not be started until the beginning of the next SCK low pulse. The device will remain in the Hold mode as long as the \overline{HOLD} pin and \overline{CS} pin are asserted.

While in Hold mode, the SO pin will be in a high-impedance state. In addition, both the SI pin and the SCK pin will be ignored. The Write-Protect (WP) pin, however, can still be asserted or deasserted while in the Hold mode.

To end the Hold mode and resume serial communication, the \overline{HOLD} pin must be deasserted during the SCK low pulse. If the \overline{HOLD} pin is deasserted during the SCK high pulse, then the Hold mode will not end until the beginning of the next SCK low pulse.

If the \overline{CS} pin is deasserted while the \overline{HOLD} pin is still asserted, then any operation that may have been started will be aborted and the device will reset the WEL bit in the STATUS register back to the logic '0' state.

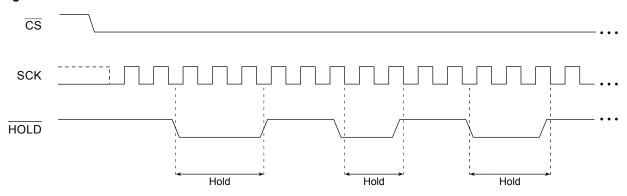

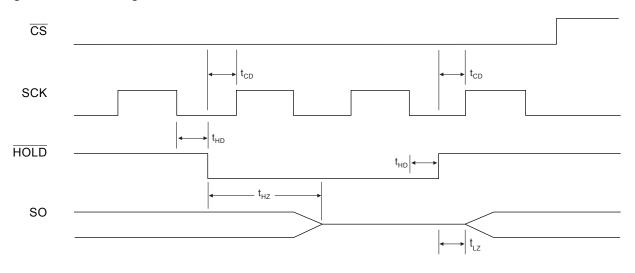

Figure 5-2. Hold Mode

Device Operation

Figure 5-3. Hold Timing

5.4 Write Protection

The Write-Protect (\overline{WP}) pin will allow normal read and write operations when held high. When the \overline{WP} pin is brought low and WPEN bit is a logic '1', all write operations to the STATUS register are inhibited. The \overline{WP} pin going low while \overline{CS} is still low will interrupt a Write STATUS Register (WRSR). If the internal write cycle has already been initiated, \overline{WP} going low will have no effect on any write operation to the STATUS register. The \overline{WP} pin function is blocked when the WPEN bit in the STATUS register is a logic '0'. This will allow the user to install the AT25080B/AT25160B device in a system with the \overline{WP} pin tied to ground and still be able to write to the STATUS register. All \overline{WP} pin functions are enabled when the WPEN bit is set to a logic '1'.

6. Device Commands and Addressing

The AT25080B/AT25160B is designed to interface directly with the synchronous Serial Peripheral Interface (SPI). The AT25080B/AT25160B utilizes an 8-bit instruction register. The list of instructions and their operation codes are contained in Table 6-1. All instructions, addresses and data are transferred with the MSb first and start with a high-to-low \overline{CS} transition.

Instruction Name	Instruction Format	Operates On	Operation Description
WREN	0000 X110	STATUS Register	Set Write Enable Latch (WEL)
WRDI	0000 X100	STATUS Register	Reset Write Enable Latch (WEL)
RDSR	0000 X101	STATUS Register	Read STATUS Register
WRSR	0000 X001	STATUS Register	Write STATUS Register
READ	0000 X011	Memory Array	Read from Memory Array
WRITE	0000 X010	Memory Array	Write to Memory Array

Table 6-1. Instruction Set for the AT25080B/AT25160B

6.1 STATUS Register Bit Definition and Function

The AT25080B/AT25160B includes an 8-bit STATUS register. The STATUS register bits modulate various features of the device as shown in Table 6-2 and Table 6-3. These bits can be changed by specific instructions that are detailed in the following sections.

Table 6-2. STATUS Register Format

Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
WPEN	Х	Х	Х	BP1	BP0	WEL	RDY/BSY

Table 6-3. STATUS Register Bit Definition

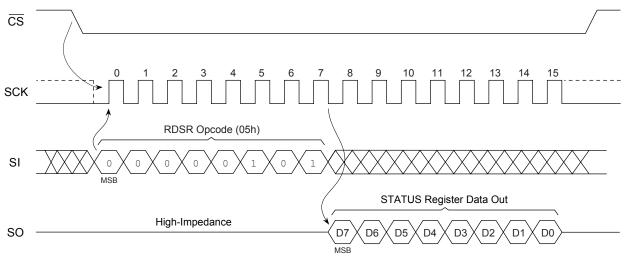

Bit		Name	Туре		Description					
7	WPEN	Write-Protect Enable	R/W	0	See Table 6-5 (Factory Default)					
				1	See Table 6-5 (Factory Default)					
6:4	RFU	Reserved for Future Use	R	0	Reads as zeros when the device is not in a write cycle					
				1	Reads as ones when the device is in a write cycle					
3:2	BP1	Block Write Protection	R/W	00	No array write protection (Factory Default)					
	BP0	ВРО	BFU		20	BP0	0		01	Quarter array write protection (see Table 6-4)
				10	Half array write protection (see Table 6-4)					
				11	Entire array write protection (see Table 6-4)					
1	WEL	Write Enable Latch	R	0	Device is not write enabled (Power-up Default)					
				1	Device is write enabled					
0	RDY/BSY	Ready/Busy Status	R	0	Device is ready for a new sequence					
				1	Device is busy with an internal operation					

© 2019 Microchip Technology Inc.

6.2 Read STATUS Register (RDSR)

The Read STATUS Register (RDSR) instruction provides access to the STATUS register. The ready/busy and write enable status of the device can be determined by the RDSR instruction. Similarly, the Block Write Protection (BP1, BP0) bits indicate the extent of memory array protection employed. The STATUS register is read by asserting the \overline{CS} pin, followed by sending in a 05h opcode on the SI pin. Upon completion of the opcode, the device will return the 8-bit STATUS register value on the SO pin.

Figure 6-1. RDSR Waveform

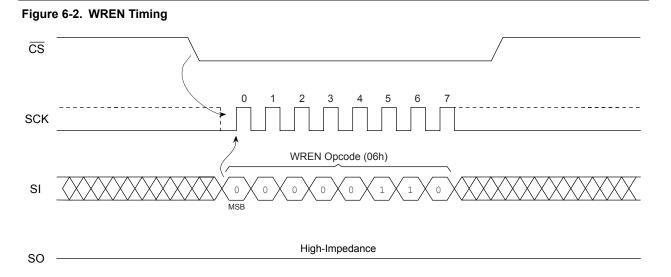

6.3 Write Enable (WREN) and Write Disable (WRDI)

Enabling and disabling writing to the STATUS register and EEPROM array is accomplished through the Write Enable (WREN) instruction and the Write Disable (WRDI) instruction. These functions change the status of the WEL bit in the STATUS register.

6.3.1 Write Enable Instruction (WREN)

The Write Enable Latch (WEL) bit of the STATUS register must be set to a logic '1' prior to each Write STATUS Register (WRSR) and Write to Memory Array (WRITE) instructions. This is accomplished by sending a WREN (06h) instruction to the AT25080B/AT25160B. First, the \overline{CS} pin is driven low to select the device and then a WREN instruction is clocked in on the SI pin. Then the \overline{CS} pin can be driven high and the WEL bit will be updated in the STATUS register to a logic '1'. The device will power-up in the Write Disable state (WEL = 0).

Device Commands and Addressing

6.3.2 Write Disable Instruction (WRDI)

To protect the device against inadvertent writes, the Write Disable (WRDI) instruction (opcode 04h) disables all programming modes by setting the WEL bit to a logic '0'. The WRDI instruction is independent of the status of the WP pin.

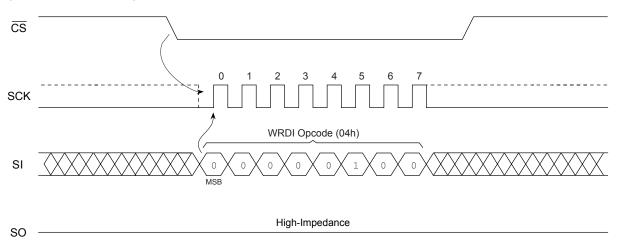

Figure 6-3. WRDI Timing

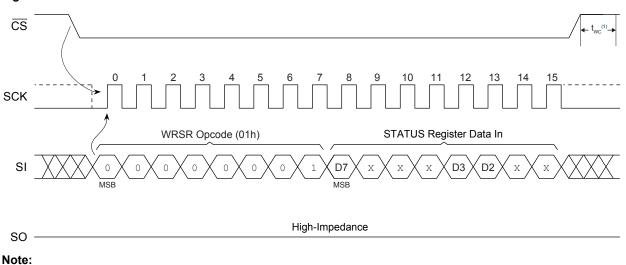

6.4 Write STATUS Register (WRSR)

The Write STATUS Register (WRSR) instruction enables the SPI Master to change selected bits of the STATUS register. Before a WRSR instruction can be initiated, a WREN instruction must be executed to set the WEL bit to logic '1'. Upon completion of a WREN instruction, a WRSR instruction can be executed.

Note: The WRSR instruction has no effect on bit 6, bit 5, bit 4, bit 1 and bit 0 of the STATUS register. Only bit 7, bit 3 and bit 2 can be changed via the WRSR instruction. These modifiable bits are the Write-Protect Enable (WPEN) and Block Protect (BP1, BP0) bits. These three bits are nonvolatile bits that have the same properties and functions as regular EEPROM cells. Their values are retained while power is removed from the device.

The AT25080B/AT25160B will not respond to commands other than a RDSR after a WRSR instruction until the self-timed internal write cycle has completed. When the write cycle is completed, the WEL bit in the STATUS register is reset to logic '0'.

Figure 6-4. WRSR Waveform

1. This instruction initiates a self-timed internal write cycle (t_{WC}) on the rising edge of CS after a valid sequence.

6.4.1 Block Write-Protect Function

The WRSR instruction allows the user to select one of four possible combinations as to how the memory array will be inhibited from writing through changing the Block Write-Protect bits (BP1, BP0). The four levels of array protection are:

- None of the memory array is protected.
- Upper quarter (1/4) address range is write-protected meaning the highest order address bits are read-only.
- Upper half (1/2) address range is write-protected meaning the highest order address bits are read-only.
- All of the memory array is write-protected meaning all address bits are read-only.

The Block Write Protection levels and corresponding STATUS register control bits are shown in Table 6-4.

Level	STATUS Re	egister Bits	Write-Protected/Read	-Only Address Range
	BP1	BP0	AT25080B	AT25160B
0	0	0	None	None
1(1/4)	0	1	0300h-03FFh	0600h-07FFh
2(1/2)	1	0	0200h-03FFh	0400h-07FFh
3(All)	1	1	0000h-03FFh	0000h-07FFh

Table 6-4. Block Write-Protect Bits

6.4.2 Write-Protect Enable Function

The WRSR instruction also allows the user to enable or disable the Write-Protect (\overline{WP}) pin through the use of the Write-Protect Enable (WPEN) bit. When the WPEN bit is set to logic '0', the ability to write the EEPROM array is dictated by the values of the Block Write-Protect (BP1, BP0) bits. The ability to write the STATUS register is controlled by the WEL bit. When the WPEN bit is set to logic '1', the STATUS register is read-only.

Hardware Write Protection is enabled when both the \overline{WP} pin is low and the WPEN bit has been set to a logic '1'. When the device is Hardware Write-Protected, writes to the STATUS register, including the Block Write-Protect, WEL and WPEN bits and to the sections in the memory array selected by the Block Write-Protect bits are disabled. When Hardware Write Protection is enabled, writes are only allowed to sections of the memory that are not block-protected.

Device Commands and Addressing

Hardware Write Protection is disabled when either the \overline{WP} pin is high or the WPEN bit is a logic '0'. When Hardware Write Protection is disabled, writes are only allowed to sections of the memory that are not block-protected. Refer to Table 6-5 for additional information.

Note: When the WPEN bit is Hardware Write-Protected, it cannot be set back to a logic '0' as long as the \overline{WP} pin is held low.

WPEN	WP Pin	WEL	Protected Blocks	Unprotected Blocks	STATUS Register
0	х	0	Protected	Protected	Protected
0	x	1	Protected	Writable	Writable
1	Low	0	Protected	Protected	Protected
1	Low	1	Protected	Writable	Protected
x	High	0	Protected	Protected	Protected
x	High	1	Protected	Writable	Writable

Table 6-5. WPEN Operation

7. Read Sequence

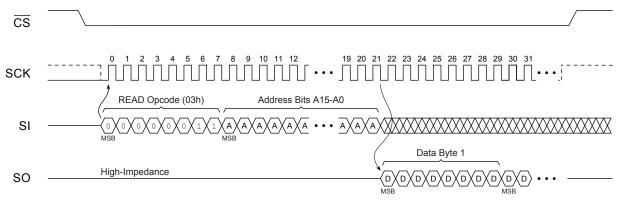

Reading the AT25080B/AT25160B via the SO pin requires the following sequence. After the \overline{CS} line is pulled low to select a device, the READ (03h) instruction is transmitted via the SI line followed by the 16-bit address to be read. Refer to Table 7-1 for the address bits for AT25080B/AT25160B.

Table 7-1. AT25080B/AT25160B Address Bits

Address	AT25080B	AT25160B
A _N	A ₉ —A ₀	A ₁₀ —A ₀
Don't Care Bits	A ₁₅ —A ₁₀	A ₁₅ —A ₁₁

Upon completion of the 16-bit address, any data on the SI line will be ignored. The data (D7-D0) at the specified address is then shifted out onto the SO line. If only one byte is to be read, the \overline{CS} line should be driven high after the data comes out. The read sequence can be continued since the byte address is automatically incremented and data will continue to be shifted out. When the highest-order address bit is reached, the address counter will rollover to the lowest-order address bit allowing the entire memory to be read in one continuous read cycle regardless of the starting address.

8. Write Sequence

In order to program the AT25080B/AT25160B, two separate instructions must be executed. First, the device *must be write enabled* via the Write Enable (WREN) instruction. Then, one of the two possible write sequences described in this section may be executed.

Note: If the device is not Write Enabled (WREN), the device will ignore the WRITE instruction and will return to the standby state when \overline{CS} is brought high. A new \overline{CS} assertion is required to re-initiate communication.

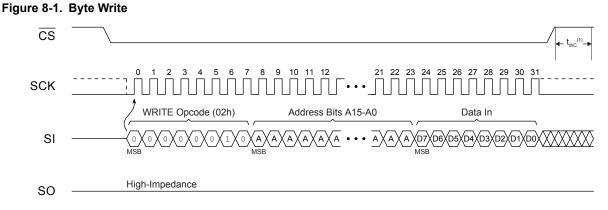

The address of the memory location(s) to be programmed must be outside the protected address field location selected by the block write protection level. During an internal write cycle, all commands will be ignored except the RDSR instruction. Refer to Table 8-1 for the address bits for AT25080B/AT25160B.

Table 8-1. AT25080B/AT25160B Address Bits

Address	AT25080B	AT25160B
A _N	A9—A0	A ₁₀ —A ₀
Don't Care Bits	A ₁₅ —A ₁₀	A ₁₅ —A ₁₁

8.1 Byte Write

A byte write requires the following sequence and is depicted in Figure 8-1. After the \overline{CS} line is pulled low to select the device, the WRITE (02h) instruction is transmitted via the SI line followed by the 16-bit address and the data (D7-D0) to be programmed. Programming will start after the \overline{CS} pin is brought high. The low-to-high transition of the \overline{CS} pin must occur during the SCK low time (Mode 0) and SCK high time (Mode 3) immediately after clocking in the D0 (LSB) data bit. The AT25080B/AT25160B is automatically returned to the Write Disable state (STATUS register bit WEL = 0) at the completion of a write cycle.

Note:

1. This instruction initiates a self-timed internal write cycle (t_{WC}) on the rising edge of \overline{CS} after a valid sequence.

8.2 Page Write

A page write sequence allows up to 32 bytes to be written in the same write cycle, provided that all bytes are in the same row of the memory array. Partial page writes of less than 32 bytes are allowed. After each byte of data is received, the five lowest order address bits are internally incremented following the receipt of each data byte. The higher order address bits are not incremented and retain the memory array page location. If more bytes of data are transmitted that what will fit to the end of that memory row, the address counter will rollover to the beginning of the same row. Nevertheless, creating a rollover event should be avoided as previously loaded data in the page could become unintentionally altered. The AT25080B/AT25160B is automatically returned to the Write Disable state (WEL = 0) at the completion of a write cycle.

Figure 8-2. Page Write CS SCK ••• WRITE Opcode (02h) Data In Byte 1 Address Bits A15-A0 Data In Byte 32 SI 0 A A) <σχοχοχοχοχοχοχογο ʹϲϪϲϪϲϪϲϪϲϪϲ σ` 0 0 High-Impedance SO

Note:

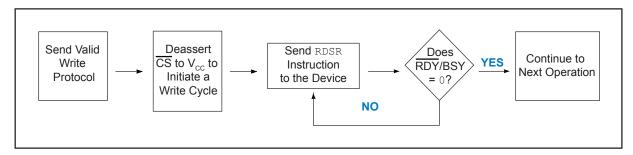

1. This instruction initiates a self-timed internal write cycle (t_{WC}) on the rising edge of \overline{CS} after a valid sequence.

8.3 Polling Routine

A polling routine can be implemented to optimize time-sensitive applications that would not prefer to wait the fixed maximum write cycle time (t_{WC}). This method allows the application to know immediately when the write cycle has completed to start a subsequent operation.

Once the internally-timed write cycle has started, a polling routine can be initiated. This involves repeatedly sending Read STATUS Register (RDSR) instruction to determine if the device has completed its self-timed internal write cycle. If the \overline{RDY}/BSY bit (bit 0 of STATUS register) = 1, the write cycle is still in progress. If bit 0 = 0, the write cycle has ended. If the \overline{RDY}/BSY bit = 1, repeated RDSR commands can be executed until the \overline{RDY}/BSY bit = 0, signaling that the device is ready to execute a new instruction. Only the Read STATUS Register (RDSR) instruction is enabled during the write cycle.

10. Revision History

Revision A (August 2019)

Updated to the Microchip template. Microchip DS20006244 replaces Atmel document 5228. Updated Part Marking Information. Added ESD rating. Removed the 8-ball WLCSP detail and ordering code. Removed lead finish designation. Added POR recommendations section. Updated trace code format in package markings. Updated section content throughout for clarification. Updated the 8U3-1 VFBGA package drawing. Updated the SOIC, TSSOP and UDFN package drawings to the Microchip equivalents.

Atmel Document 5228 Revision G (January 2015)

Add the AT25080B-MAHL-E and AT25160B-MAHL-E package options. Update the 8MA2 and 8U-12 package drawings and the ordering information.

Atmel Document 5228 Revision F (July 2014)

Add WLSCP package option. Update 8X, 8MA2, 8ME1, and 8U3-1 package drawings. Update template, Atmel logos, disclaimer page.

Atmel Document 5228 Revision E (March 2012)

Update 8A2 to 8X and 8S1, 8MA2, 8U3-1 package drawings.

Atmel Document 5228 Revision D (April 2010)

Update Ordering Code Detail and Ordering Information.

Atmel Document 5228 Revision C (August 2009)

Change Catalog Scheme and add Marking Details.

Atmel Document 5228 Revision B (July 2008)

Change 'Endurance' parameter on page 6.

Atmel Document 5228 Revision A (September 2007)

Initial document release.

The Microchip Website

Microchip provides online support via our website at http://www.microchip.com/. This website is used to make files and information easily available to customers. Some of the content available includes:

- **Product Support** Data sheets and errata, application notes and sample programs, design resources, user's guides and hardware support documents, latest software releases and archived software
- General Technical Support Frequently Asked Questions (FAQs), technical support requests, online discussion groups, Microchip design partner program member listing
- **Business of Microchip** Product selector and ordering guides, latest Microchip press releases, listing of seminars and events, listings of Microchip sales offices, distributors and factory representatives

Product Change Notification Service

Microchip's product change notification service helps keep customers current on Microchip products. Subscribers will receive email notification whenever there are changes, updates, revisions or errata related to a specified product family or development tool of interest.

To register, go to http://www.microchip.com/pcn and follow the registration instructions.

Customer Support

Users of Microchip products can receive assistance through several channels:

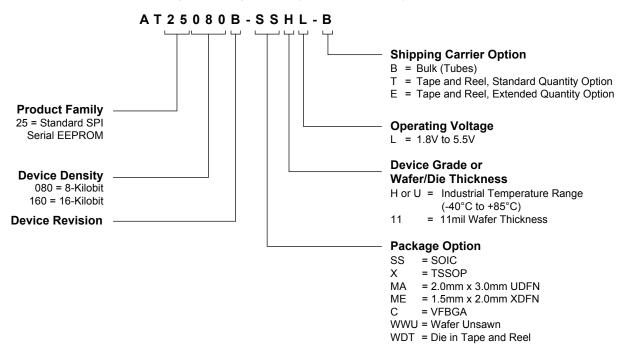

- Distributor or Representative
- Local Sales Office
- Embedded Solutions Engineer (ESE)
- Technical Support

Customers should contact their distributor, representative or ESE for support. Local sales offices are also available to help customers. A listing of sales offices and locations is included in this document.

Technical support is available through the website at: http://www.microchip.com/support

Microchip Devices Code Protection Feature

Note the following details of the code protection feature on Microchip devices:

- Microchip products meet the specification contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip's Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.
- · Microchip is willing to work with the customer who is concerned about the integrity of their code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as "unbreakable."

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip's code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.

Legal Notice

Information contained in this publication regarding device applications and the like is provided only for your convenience and may be superseded by updates. It is your responsibility to ensure that your application meets with your specifications. MICROCHIP MAKES NO REPRESENTATIONS OR WARRANTIES OF ANY KIND WHETHER EXPRESS OR IMPLIED, WRITTEN OR ORAL, STATUTORY OR OTHERWISE, RELATED TO THE INFORMATION, INCLUDING BUT NOT LIMITED TO ITS CONDITION, QUALITY, PERFORMANCE, MERCHANTABILITY OR FITNESS FOR PURPOSE. Microchip disclaims all liability arising from this information and its use. Use of Microchip devices in life support and/or safety applications is entirely at the buyer's risk, and the buyer agrees to defend, indemnify and hold harmless Microchip from any and all damages, claims, suits, or expenses resulting from such use. No licenses are conveyed, implicitly or otherwise, under any Microchip intellectual property rights unless otherwise stated.

Trademarks

The Microchip name and logo, the Microchip logo, Adaptec, AnyRate, AVR, AVR logo, AVR Freaks, BesTime, BitCloud, chipKIT, chipKIT logo, CryptoMemory, CryptoRF, dsPIC, FlashFlex, flexPWR, HELDO, IGLOO, JukeBlox, KeeLoq, Kleer, LANCheck, LinkMD, maXStylus, maXTouch, MediaLB, megaAVR, Microsemi, Microsemi logo, MOST, MOST logo, MPLAB, OptoLyzer, PackeTime, PIC, picoPower, PICSTART, PIC32 logo, PolarFire, Prochip Designer, QTouch, SAM-BA, SenGenuity, SpyNIC, SST, SST Logo, SuperFlash, Symmetricom, SyncServer, Tachyon, TempTrackr, TimeSource, tinyAVR, UNI/O, Vectron, and XMEGA are registered trademarks of Microchip Technology Incorporated in the U.S.A. and other countries.

APT, ClockWorks, The Embedded Control Solutions Company, EtherSynch, FlashTec, Hyper Speed Control, HyperLight Load, IntelliMOS, Libero, motorBench, mTouch, Powermite 3, Precision Edge, ProASIC, ProASIC Plus, ProASIC Plus logo, Quiet-Wire, SmartFusion, SyncWorld, Temux, TimeCesium, TimeHub, TimePictra, TimeProvider, Vite, WinPath, and ZL are registered trademarks of Microchip Technology Incorporated in the U.S.A.

Adjacent Key Suppression, AKS, Analog-for-the-Digital Age, Any Capacitor, AnyIn, AnyOut, BlueSky, BodyCom, CodeGuard, CryptoAuthentication, CryptoAutomotive, CryptoCompanion, CryptoController, dsPICDEM, dsPICDEM.net, Dynamic Average Matching, DAM, ECAN, EtherGREEN, In-Circuit Serial Programming, ICSP, INICnet, Inter-Chip Connectivity, JitterBlocker, KleerNet, KleerNet logo, memBrain, Mindi, MiWi, MPASM, MPF, MPLAB Certified logo, MPLIB, MPLINK, MultiTRAK, NetDetach, Omniscient Code Generation, PICDEM, PICDEM.net, PICkit, PICtail, PowerSmart, PureSilicon, QMatrix, REAL ICE, Ripple Blocker, SAM-ICE, Serial Quad I/O, SMART-I.S., SQI, SuperSwitcher, SuperSwitcher II, Total Endurance, TSHARC, USBCheck, VariSense, ViewSpan, WiperLock, Wireless DNA, and ZENA are trademarks of Microchip Technology Incorporated in the U.S.A. and other countries.

SQTP is a service mark of Microchip Technology Incorporated in the U.S.A.

The Adaptec logo, Frequency on Demand, Silicon Storage Technology, and Symmcom are registered trademarks of Microchip Technology Inc. in other countries.

© 2019 Microchip Technology Inc.

GestIC is a registered trademark of Microchip Technology Germany II GmbH & Co. KG, a subsidiary of Microchip Technology Inc., in other countries.

All other trademarks mentioned herein are property of their respective companies.
