## 8/10/12-Bit Dual Voltage Output Digital-to-Analog Converter with Internal $V_{REF}$ and SPI Interface

### Features

- MCP4802: Dual 8-Bit Voltage Output DAC
- MCP4812: Dual 10-Bit Voltage Output DAC
- MCP4822: Dual 12-Bit Voltage Output DAC
- Rail-to-Rail Output
- SPI Interface with 20 MHz Clock Support
- Simultaneous Latching of the Dual DACs with LDAC pin
- Fast Settling Time of 4.5  $\mu$ s
- Selectable Unity or 2x Gain Output
- 2.048V Internal Voltage Reference
- 50 ppm/ $^{\circ}$ C  $V_{REF}$  Temperature Coefficient
- 2.7V to 5.5V Single-Supply Operation
- Extended Temperature Range:  $-40^{\circ}$ C to  $+125^{\circ}$ C

### Applications

- Set Point or Offset Trimming
- Sensor Calibration
- Precision Selectable Voltage Reference
- Portable Instrumentation (Battery-Powered)
- Calibration of Optical Communication Devices

### Description

The MCP4802/4812/4822 devices are dual 8-bit, 10-bit and 12-bit buffered voltage output Digital-to-Analog Converters (DACs), respectively. The devices operate from a single 2.7V to 5.5V supply with SPI compatible Serial Peripheral Interface.

The devices have a high precision internal voltage reference ( $V_{REF} = 2.048V$ ). The user can configure the full-scale range of the device to be 2.048V or 4.096V by setting the Gain Selection Option bit (gain of 1 of 2).

Each DAC channel can be operated in Active or Shutdown mode individually by setting the Configuration register bits. In Shutdown mode, most of the internal circuits in the shutdown channel are turned off for power savings and the output amplifier is configured to present a known high resistance output load (500 k $\Omega$ , typical).

The devices include double-buffered registers, allowing synchronous updates of two DAC outputs using the LDAC pin. These devices also incorporate a Power-on Reset (POR) circuit to ensure reliable power-up.

The devices utilize a resistive string architecture, with its inherent advantages of low DNL error, low ratio metric temperature coefficient and fast settling time. These devices are specified over the extended temperature range ( $+125^{\circ}$ C).

The devices provide high accuracy and low noise performance for consumer and industrial applications where calibration or compensation of signals (such as temperature, pressure and humidity) are required.

The MCP4802/4812/4822 devices are available in the PDIP, SOIC and MSOP packages.

## Block Diagram

## 1.0 ELECTRICAL CHARACTERISTICS

### Absolute Maximum Ratings †

V <sub>DD</sub> .....	6.5V
All inputs and outputs .....	V <sub>SS</sub> – 0.3V to V <sub>DD</sub> + 0.3V
Current at Input Pins .....	±2 mA
Current at Supply Pins .....	±50 mA
Current at Output Pins .....	±25 mA
Storage temperature .....	-65°C to +150°C
Ambient temp. with power applied .....	-55°C to +125°C
ESD protection on all pins ≥ 4 kV (HBM), ≥ 400V (MM)	
Maximum Junction Temperature (T <sub>J</sub> ).....	+150°C

† **Notice:** Stresses above those listed under “Maximum Ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device at those or any other conditions above those indicated in the operational listings of this specification is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability.

## ELECTRICAL CHARACTERISTICS

Electrical Specifications: Unless otherwise indicated, V <sub>DD</sub> = 5V, V <sub>SS</sub> = 0V, V <sub>REF</sub> = 2.048V, Output Buffer Gain (G) = 2x, R <sub>L</sub> = 5 kΩ to GND, C <sub>L</sub> = 100 pF, T <sub>A</sub> = -40 to +85°C. Typical values are at +25°C.

## 3.0 PIN DESCRIPTIONS

The descriptions of the pins are listed in [Table 3-1](#).

**TABLE 3-1: PIN FUNCTION TABLE FOR MCP4802/4812/4822**

MCP4802/4812/4822	Symbol	Description
MSOP, PDIP, SOIC		
1	$V_{DD}$	Supply Voltage Input (2.7V to 5.5V)
2	$\overline{CS}$	Chip Select Input
3	SCK	Serial Clock Input
4	SDI	Serial Data Input
5	$\overline{LDAC}$	Synchronization Input. This pin is used to transfer DAC settings (Input Registers) to the output registers ( $V_{OUT}$ )
6	$V_{OUTB}$	DAC <sub>B</sub> Output
7	$V_{SS}$	Ground reference point for all circuitry on the device
8	$V_{OUTA}$	DAC <sub>A</sub> Output

### 3.1 Supply Voltage Pins ( $V_{DD}$ , $V_{SS}$ )

$V_{DD}$  is the positive supply voltage input pin. The input supply voltage is relative to  $V_{SS}$  and can range from 2.7V to 5.5V. The power supply at the  $V_{DD}$  pin should be as clean as possible for a good DAC performance. It is recommended to use an appropriate bypass capacitor of about 0.1  $\mu$ F (ceramic) to ground. An additional 10  $\mu$ F capacitor (tantalum) in parallel is also recommended to further attenuate high-frequency noise present in application boards.

$V_{SS}$  is the analog ground pin and the current return path of the device. The user must connect the  $V_{SS}$  pin to a ground plane through a low-impedance connection. If an analog ground path is available in the application Printed Circuit Board (PCB), it is highly recommended that the  $V_{SS}$  pin be tied to the analog ground path or isolated within an analog ground plane of the circuit board.

### 3.2 Chip Select ( $\overline{CS}$ )

$\overline{CS}$  is the Chip Select input pin, which requires an active-low to enable serial clock and data functions.

### 3.3 Serial Clock Input (SCK)

SCK is the SPI compatible serial clock input pin.

### 3.4 Serial Data Input (SDI)

SDI is the SPI compatible serial data input pin.

### 3.5 Latch DAC Input ( $\overline{LDAC}$ )

$\overline{LDAC}$  (latch DAC synchronization input) pin is used to transfer the input latch registers to their corresponding DAC registers (output latches,  $V_{OUT}$ ). When this pin is low, both  $V_{OUTA}$  and  $V_{OUTB}$  are updated at the same time with their input register contents. This pin can be tied to low ( $V_{SS}$ ) if the  $V_{OUT}$  update is desired at the rising edge of the  $\overline{CS}$  pin. This pin can be driven by an external control device such as an MCU I/O pin.

### 3.6 Analog Outputs ( $V_{OUTA}$ , $V_{OUTB}$ )

$V_{OUTA}$  is the DAC A output pin, and  $V_{OUTB}$  is the DAC B output pin. Each output has its own output amplifier. The full-scale range of the DAC output is from  $V_{SS}$  to  $G \cdot V_{REF}$  where G is the gain selection option (1x or 2x). The DAC analog output cannot go higher than the supply voltage ( $V_{DD}$ ).

NOTES:

## 4.0 GENERAL OVERVIEW

The MCP4802, MCP4812 and MCP4822 are dual voltage output 8-bit, 10-bit and 12-bit DAC devices, respectively. These devices include rail-to-rail output amplifiers, internal voltage reference, shutdown and reset-management circuitry. The devices use an SPI serial communication interface and operate with a single supply voltage from 2.7V to 5.5V.

The DAC input coding of these devices is straight binary. Equation 4-1 shows the DAC analog output voltage calculation.

### EQUATION 4-1: ANALOG OUTPUT VOLTAGE ( $V_{OUT}$ )

$$V_{OUT} = \frac{(2.048V \times D_n)}{2^n} \times G$$

Where:

- 2.048V = Internal voltage reference
- $D_n$  = DAC input code
- G = Gain selection
  - = 2 for  $\overline{GA}$  bit = 0
  - = 1 for  $\overline{GA}$  bit = 1
- n = DAC Resolution
  - = 8 for MCP4802
  - = 10 for MCP4812
  - = 12 for MCP4822

The ideal output range of each device is:

- **MCP4802 (n = 8)**
  - (a) 0.0V to  $255/256 * 2.048V$  when gain setting = 1x.
  - (b) 0.0V to  $255/256 * 4.096V$  when gain setting = 2x.
- **MCP4812 (n = 10)**
  - (a) 0.0V to  $1023/1024 * 2.048V$  when gain setting = 1x.
  - (b) 0.0V to  $1023/1024 * 4.096V$  when gain setting = 2x.
- **MCP4822 (n = 12)**
  - (a) 0.0V to  $4095/4096 * 2.048V$  when gain setting = 1x.
  - (b) 0.0V to  $4095/4096 * 4.096V$  when gain setting = 2x.

**Note:** See the output swing voltage specification in Section 1.0 "Electrical Characteristics".

1 LSB is the ideal voltage difference between two successive codes. Table 4-1 illustrates the LSB calculation of each device.

**TABLE 4-1: LSB OF EACH DEVICE**

Device	Gain Selection	LSb Size
MCP4802 (n = 8)	1x	$2.048V/256 = 8 \text{ mV}$
	2x	$4.096V/256 = 16 \text{ mV}$
MCP4812 (n = 10)	1x	$2.048V/1024 = 2 \text{ mV}$
	2x	$4.096V/1024 = 4 \text{ mV}$
MCP4822 (n = 12)	1x	$2.048V/4096 = 0.5 \text{ mV}$
	2x	$4.096V/4096 = 1 \text{ mV}$

### 4.0.1 INL ACCURACY

Integral Non-Linearity (INL) error for these devices is the maximum deviation between an actual code transition point and its corresponding ideal transition point once offset and gain errors have been removed. The two end points method (from 0x000 to 0xFFFF) is used for the calculation. Figure 4-1 shows the details.

A positive INL error represents transition(s) later than ideal. A negative INL error represents transition(s) earlier than ideal.

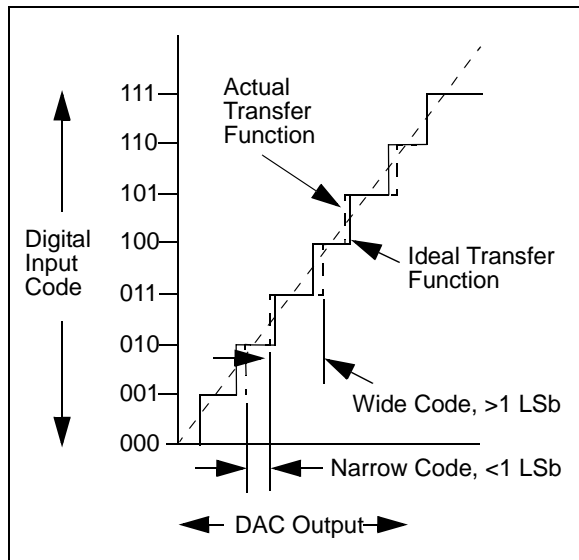

**FIGURE 4-1:** Example for INL Error.

# MCP4802/4812/4822

## 4.0.2 DNL ACCURACY

A Differential Non-Linearity (DNL) error is the measure of variations in code widths from the ideal code width. A DNL error of zero indicates that every code is exactly 1 LSB wide.

**FIGURE 4-2:** Example for DNL Error.

## 4.0.3 OFFSET ERROR

An offset error is the deviation from zero voltage output when the digital input code is zero.

## 4.0.4 GAIN ERROR

A gain error is the deviation from the ideal output,  $V_{REF} - 1 \text{LSb}$ , excluding the effects of offset error.

## 4.1 Circuit Descriptions

### 4.1.1 OUTPUT AMPLIFIERS

The DAC's outputs are buffered with a low-power, precision CMOS amplifier. This amplifier provides low offset voltage and low noise. The output stage enables the device to operate with output voltages close to the power supply rails. Refer to [Section 1.0 "Electrical Characteristics"](#) for the analog output voltage range and load conditions.

In addition to resistive load-driving capability, the amplifier will also drive high capacitive loads without oscillation. The amplifier's strong outputs allow  $V_{OUT}$  to be used as a programmable voltage reference in a system.

#### 4.1.1.1 Programmable Gain Block

The rail-to-rail output amplifier has two configurable gain options: a gain of 1x ( $\langle \overline{GA} \rangle = 1$ ) or a gain of 2x ( $\langle \overline{GA} \rangle = 0$ ). The default value for this bit is a gain of 2 ( $\langle \overline{GA} \rangle = 0$ ). This results in an ideal full-scale output of 0.000V to 4.096V due to the internal reference ( $V_{REF} = 2.048\text{V}$ ).

### 4.1.2 VOLTAGE REFERENCE

The MCP4802/4812/4822 devices utilize internal 2.048V voltage reference. The voltage reference has a low temperature coefficient and low noise characteristics. Refer to [Section 1.0 "Electrical Characteristics"](#) for the voltage reference specifications.

## 4.1.3 POWER-ON RESET CIRCUIT

The internal Power-on Reset (POR) circuit monitors the power supply voltage ( $V_{DD}$ ) during the device operation. The circuit also ensures that the DAC powers up with high output impedance ( $\langle SHDN \rangle = 0$ , typically  $500\text{ k}\Omega$ ). The devices will continue to have a high-impedance output until a valid write command is received and the  $\overline{LDAC}$  pin meets the input low threshold.

If the power supply voltage is less than the POR threshold ( $V_{POR} = 2.0\text{V}$ , typical), the DACs will be held in their Reset state. The DACs will remain in that state until  $V_{DD} > V_{POR}$  and a subsequent write command is received.

Figure 4-3 shows a typical power supply transient pulse and the duration required to cause a reset to occur, as well as the relationship between the duration and trip voltage. A  $0.1\text{ }\mu\text{F}$  decoupling capacitor, mounted as close as possible to the  $V_{DD}$  pin, can provide additional transient immunity.

FIGURE 4-3: Typical Transient Response.

## 4.1.4 SHUTDOWN MODE

The user can shut down each DAC channel selectively using a software command ( $\langle SHDN \rangle = 0$ ). During Shutdown mode, most of the internal circuits in the channel that was shut down are turned off for power savings. The internal reference is not affected by the shutdown command. The serial interface also remains active, thus allowing a write command to bring the device out of the Shutdown mode. There will be no analog output at the channel that was shut down and the  $V_{OUT}$  pin is internally switched to a known resistive load ( $500\text{ k}\Omega$ , typical). Figure 4-4 shows the analog output stage during the Shutdown mode.

The device will remain in Shutdown mode until the  $\langle SHDN \rangle$  bit = 1 is latched into the device. When a DAC channel is changed from Shutdown to Active mode, the output settling time takes  $< 10\text{ }\mu\text{s}$ , but greater than the standard active mode settling time ( $4.5\text{ }\mu\text{s}$ ).

FIGURE 4-4: Output Stage for Shutdown Mode.

NOTES:

## 5.0 SERIAL INTERFACE

### 5.1 Overview

The MCP4802/4812/4822 devices are designed to interface directly with the Serial Peripheral Interface (SPI) port, available on many microcontrollers, and supports Mode 0,0 and Mode 1,1. Commands and data are sent to the device via the SDI pin, with data being clocked-in on the rising edge of SCK. The communications are unidirectional and, thus, data cannot be read out of the MCP4802/4812/4822 devices. The  $\overline{CS}$  pin must be held low for the duration of a write command. The write command consists of 16 bits and is used to configure the DAC's control and data latches. [Register 5-1](#) to [Register 5-3](#) detail the input register that is used to configure and load the DAC<sub>A</sub> and DAC<sub>B</sub> registers for each device. [Figure 5-1](#) to [Figure 5-3](#) show the write command for each device.

Refer to [Figure 1-1](#) and SPI Timing Specifications Table for detailed input and output timing specifications for both Mode 0,0 and Mode 1,1 operation.

### 5.2 Write Command

The write command is initiated by driving the  $\overline{CS}$  pin low, followed by clocking the four Configuration bits and the 12 data bits into the SDI pin on the rising edge of SCK. The  $\overline{CS}$  pin is then raised, causing the data to be latched into the selected DAC's input registers.

The MCP4802/4812/4822 devices utilize a double-buffered latch structure to allow both DAC<sub>A</sub>'s and DAC<sub>B</sub>'s outputs to be synchronized with the  $\overline{LDAC}$  pin, if desired.

By bringing down the  $\overline{LDAC}$  pin to a low state, the contents stored in the DAC's input registers are transferred into the DAC's output registers ( $V_{OUT}$ ), and both  $V_{OUTA}$  and  $V_{OUTB}$  are updated at the same time.

All writes to the MCP4802/4812/4822 devices are 16-bit words. Any clocks after the first 16<sup>th</sup> clock will be ignored. The Most Significant four bits are Configuration bits. The remaining 12 bits are data bits. No data can be transferred into the device with  $\overline{CS}$  high. The data transfer will only occur if 16 clocks have been transferred into the device. If the rising edge of  $\overline{CS}$  occurs prior, shifting of data into the input registers will be aborted.

NOTES:

## 6.0 TYPICAL APPLICATIONS

The MCP4802/4812/4822 family of devices are general purpose DACs for various applications where a precision operation with low-power and internal voltage reference is required.

Applications generally suited for the devices are:

- Set Point or Offset Trimming
- Sensor Calibration
- Precision Selectable Voltage Reference
- Portable Instrumentation (Battery-Powered)
- Calibration of Optical Communication Devices

### 6.1 Digital Interface

The MCP4802/4812/4822 devices utilize a 3-wire synchronous serial protocol to transfer the DAC's setup and input codes from the digital devices. The serial protocol can be interfaced to SPI or Microwire peripherals that is common on many microcontroller units (MCUs), including Microchip's PIC<sup>®</sup> MCUs and dsPIC<sup>®</sup> DSCs.

In addition to the three serial connections ( $\overline{CS}$ , SCK and SDI), the  $\overline{LDAC}$  signal synchronizes the two DAC outputs. By bringing down the  $\overline{LDAC}$  pin to "low", all DAC input codes and settings in the two DAC input registers are latched into their DAC output registers at the same time. Therefore, both DAC<sub>A</sub> and DAC<sub>B</sub> outputs are updated at the same time. Figure 6-1 shows an example of the pin connections. Note that the  $\overline{LDAC}$  pin can be tied low ( $V_{SS}$ ) to reduce the required connections from four to three I/O pins. In this case, the DAC output can be immediately updated when a valid 16 clock transmission has been received and the  $\overline{CS}$  pin has been raised.

### 6.2 Power Supply Considerations

The typical application will require a bypass capacitor in order to filter out the noise in the power supply traces. The noise can be induced onto the power supply's traces from various events such as digital switching or as a result of changes on the DAC's output. The bypass capacitor helps to minimize the effect of these noise sources. Figure 6-1 illustrates an appropriate bypass strategy. In this example, two bypass capacitors are used in parallel: (a) 0.1  $\mu\text{F}$  (ceramic) and (b) 10  $\mu\text{F}$  (tantalum). These capacitors should be placed as close to the device power pin ( $V_{DD}$ ) as possible (within 4 mm).

The power source supplying these devices should be as clean as possible. If the application circuit has separate digital and analog power supplies,  $V_{DD}$  and  $V_{SS}$  of the device should reside on the analog plane.

### 6.3 Output Noise Considerations

The voltage noise density (in  $\mu\text{V}/\sqrt{\text{Hz}}$ ) is illustrated in Figure 2-13. This noise appears at  $V_{OUTX}$ , and is primarily a result of the internal reference voltage. Its 1/f corner ( $f_{\text{CORNER}}$ ) is approximately 400 Hz.

Figure 2-14 illustrates the voltage noise (in  $\text{mV}_{\text{RMS}}$  or  $\text{mV}_{\text{P-P}}$ ). A small bypass capacitor on  $V_{OUTX}$  is an effective method to produce a single-pole Low-Pass Filter (LPF) that will reduce this noise. For instance, a bypass capacitor sized to produce a 1 kHz LPF would result in an  $E_{\text{NREF}}$  of about 100  $\mu\text{V}_{\text{RMS}}$ . This would be necessary when trying to achieve the low DNL error performance (at  $G = 1$ ) that the MCP4802/4812/4822 devices are capable of. The tested range for stability is .001  $\mu\text{F}$  through 4.7  $\mu\text{F}$ .

FIGURE 6-1: Typical Connection Diagram.

### 6.4 Layout Considerations

Inductively-coupled AC transients and digital switching noises can degrade the output signal integrity, and potentially reduce the device performance. Careful board layout will minimize these effects and increase the Signal-to-Noise Ratio (SNR). Bench testing has shown that a multi-layer board utilizing a low-inductance ground plane, isolated inputs and isolated outputs with proper decoupling, is critical for the best performance. Particularly harsh environments may require shielding of critical signals.

Breadboards and wire-wrapped boards are not recommended if low noise is desired.

# MCP4802/4812/4822

## 6.5 Single-Supply Operation

The MCP4802/4812/4822 family of devices are rail-to-rail voltage output DAC devices designed to operate with a  $V_{DD}$  range of 2.7V to 5.5V. Its output amplifier is robust enough to drive small-signal loads directly. Therefore, it does not require any external output buffer for most applications.

### 6.5.1 DC SET POINT OR CALIBRATION

A common application for the devices is a digitally-controlled set point and/or calibration of variable parameters, such as sensor offset or slope. For example, the MCP4822 provides 4096 output steps. If  $G = 1$  is selected, the internal 2.048V  $V_{REF}$  would produce 500  $\mu$ V of resolution. If  $G = 2$  is selected, the internal 2.048  $V_{REF}$  would produce 1 mV of resolution.

### 6.5.1.1 Decreasing Output Step Size

If the application is calibrating the bias voltage of a diode or transistor, a bias voltage range of 0.8V may be desired with about 200  $\mu$ V resolution per step. Two common methods to achieve a 0.8V range are to either reduce  $V_{REF}$  to 0.82V (using the MCP49XX family device that uses external reference) or use a voltage divider on the DAC's output.

Using a  $V_{REF}$  is an option if the  $V_{REF}$  is available with the desired output voltage range. However, occasionally, when using a low-voltage  $V_{REF}$  the noise floor causes SNR error that is intolerable. Using a voltage divider method is another option and provides some advantages when  $V_{REF}$  needs to be very low or when the desired output voltage is not available. In this case, a larger value  $V_{REF}$  is used while two resistors scale the output range down to the precise desired level.

**Example 6-1** illustrates this concept. Note that the bypass capacitor on the output of the voltage divider plays a critical function in attenuating the output noise of the DAC and the induced noise from the environment.

### EXAMPLE 6-1: EXAMPLE CIRCUIT OF SET POINT OR THRESHOLD CALIBRATION

## 6.5.1.2 Building a “Window” DAC

When calibrating a set point or threshold of a sensor, typically only a small portion of the DAC output range is utilized. If the LSb size is adequate enough to meet the application’s accuracy needs, the unused range is sacrificed without consequences. If greater accuracy is needed, then the output range will need to be reduced to increase the resolution around the desired threshold.

If the threshold is not near  $V_{REF}$ ,  $2V_{REF}$  or  $V_{SS}$ , then creating a “window” around the threshold has several advantages. One simple method to create this “window” is to use a voltage divider network with a pull-up and pull-down resistor. [Example 6-2](#) shows this concept.

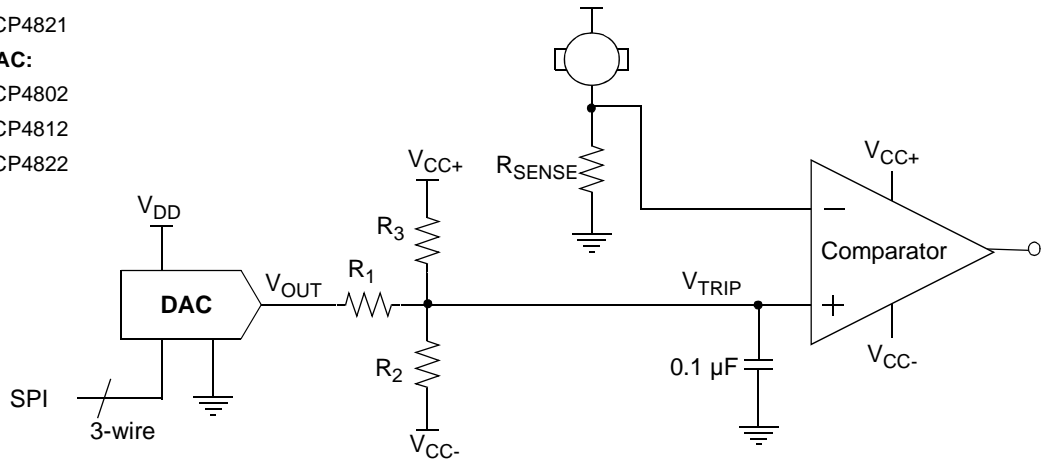

### EXAMPLE 6-2: SINGLE-SUPPLY “WINDOW” DAC

**(a) Single Output DAC:**

MCP4801

MCP4821

**(b) Dual Output DAC:**

MCP4802  
MCP4812  
MCP4822

$$V_{OUT} = 2.048 \cdot G \cdot \frac{D_n}{2^N}$$

- G = Gain selection (1x or 2x)
- $D_n$  = Digital value of DAC (0-255) for MCP4801/MCP4802  
= Digital value of DAC (0-1023) for MCP4811/MCP4812  
= Digital value of DAC (0-4095) for MCP4821/MCP4822
- N = DAC bit resolution

Thevenin Equivalent

$$R_{23} = \frac{R_2 R_3}{R_2 + R_3}$$

$$V_{23} = \frac{(V_{CC+} R_2) + (V_{CC-} R_3)}{R_2 + R_3}$$

$$V_{trip} = \frac{V_{OUT} R_{23} + V_{23} R_1}{R_1 + R_{23}}$$

# MCP4802/4812/4822

## 6.6 Bipolar Operation

Bipolar operation is achievable using the MCP4802/4812/4822 family of devices by utilizing an external operational amplifier (op amp). This configuration is desirable due to the wide variety and availability of op amps. This allows a general purpose DAC, with its cost and availability advantages, to meet almost any desired output voltage range, power and noise performance.

Example 6-3 illustrates a simple bipolar voltage source configuration.  $R_1$  and  $R_2$  allow the gain to be selected, while  $R_3$  and  $R_4$  shift the DAC's output to a selected offset. Note that  $R_4$  can be tied to  $V_{DD}$ , instead of  $V_{SS}$ , if a higher offset is desired. Also note that a pull-up to  $V_{DD}$  could be used instead of  $R_4$ , or in addition to  $R_4$ , if a higher offset is desired.

### EXAMPLE 6-3: DIGITALLY-CONTROLLED BIPOLAR VOLTAGE SOURCE

**(a) Single Output DAC:**  
MCP4801

MCP4821

**(b) Dual Output DAC:**  
MCP4802  
MCP4812  
MCP4822

$$V_{OUT} = 2.048 \cdot G \cdot \frac{D_n}{2^N}$$

$$V_{IN+} = \frac{V_{OUT}R_4}{R_3 + R_4}$$

$$V_O = V_{IN+} \left( 1 + \frac{R_2}{R_1} \right) - V_{DD} \left( \frac{R_2}{R_1} \right)$$

G = Gain selection (1x or 2x)  
 $D_n$  = Digital value of DAC (0-255) for MCP4801/MCP4802  
 = Digital value of DAC (0-1023) for MCP4811/MCP4812  
 = Digital value of DAC (0-4095) for MCP4821/MCP4822  
 N = DAC bit resolution

#### 6.6.1 DESIGN EXAMPLE: DESIGN A BIPOLAR DAC USING Example 6-3 WITH 12-BIT MCP4822 OR MCP4821

An output step magnitude of 1 mV, with an output range of  $\pm 2.05V$ , is desired for a particular application.

**Step 1:** Calculate the range:  $+2.05V - (-2.05V) = 4.1V$ .

**Step 2:** Calculate the resolution needed:

$$4.1V/1 \text{ mV} = 4100$$

Since  $2^{12} = 4096$ , 12-bit resolution is desired.

**Step 3:** The amplifier gain ( $R_2/R_1$ ), multiplied by full-scale  $V_{OUT}$  (4.096V), must be equal to the desired minimum output to achieve bipolar operation. Since any gain can be realized by choosing resistor values ( $R_1+R_2$ ), the  $V_{REF}$  value must be selected first. If a  $V_{REF}$  of 4.096V is used ( $G=2$ ), solve for the amplifier's gain by setting the DAC to 0, knowing that the output needs to be -2.05V.

The equation can be simplified to:

$$\frac{-R_2}{R_1} = \frac{-2.05}{4.096V} \quad \frac{R_2}{R_1} = \frac{1}{2}$$

If  $R_1 = 20 \text{ k}\Omega$  and  $R_2 = 10 \text{ k}\Omega$ , the gain will be 0.5.

**Step 4:** Next, solve for  $R_3$  and  $R_4$  by setting the DAC to 4096, knowing that the output needs to be +2.05V.

$$\frac{R_4}{(R_3 + R_4)} = \frac{2.05V + (0.5 \cdot 4.096V)}{1.5 \cdot 4.096V} = \frac{2}{3}$$

If  $R_4 = 20 \text{ k}\Omega$ , then  $R_3 = 10 \text{ k}\Omega$

## 6.7 Selectable Gain and Offset Bipolar Voltage Output Using a Dual Output DAC

In some applications, precision digital control of the output range is desirable. [Example 6-4](#) illustrates how to use the MCP4802/4812/4822 family of devices to achieve this in a bipolar or single-supply application.

This circuit is typically used for linearizing a sensor whose slope and offset varies.

The equation to design a bipolar “window” DAC would be utilized if  $R_3$ ,  $R_4$  and  $R_5$  are populated.

### EXAMPLE 6-4: BIPOLAR VOLTAGE SOURCE WITH SELECTABLE GAIN AND OFFSET

**Dual Output DAC:**  
MCP4802  
MCP4812  
MCP4822

$V_{OUTA} = 2.048 \cdot G_A \cdot \frac{D_n}{2^N}$

$V_{OUTB} = 2.048 \cdot G_B \cdot \frac{D_n}{2^N}$

$V_{IN+} = \frac{V_{OUTB}R_4 + V_{CC-}R_3}{R_3 + R_4}$

$V_O = V_{IN+} \left( 1 + \frac{R_2}{R_1} \right) - V_{OUTA} \left( \frac{R_2}{R_1} \right)$

Offset Adjust    Gain Adjust

**Bipolar “Window” DAC using  $R_4$  and  $R_5$**

Thevenin Equivalent  $\left\{ \begin{array}{l} V_{45} = \frac{V_{CC+}R_4 + V_{CC-}R_5}{R_4 + R_5} \\ R_{45} = \frac{R_4R_5}{R_4 + R_5} \end{array} \right.$

$V_{IN+} = \frac{V_{OUTB}R_{45} + V_{45}R_3}{R_3 + R_{45}}$

$V_O = V_{IN+} \left( 1 + \frac{R_2}{R_1} \right) - V_{OUTA} \left( \frac{R_2}{R_1} \right)$

Offset Adjust    Gain Adjust

# MCP4802/4812/4822

## 6.8 Designing a Double-Precision DAC Using a Dual DAC

Example 6-5 illustrates how to design a single-supply voltage output capable of up to 24-bit resolution from a dual 12-bit DAC (MCP4822). This design is simply a voltage divider with a buffered output.

As an example, if an application similar to the one developed in Section 6.6.1 “Design Example: Design a Bipolar DAC Using Example 6-3 with 12-bit MCP4822 or MCP4821” required a resolution of 1 μV instead of 1 mV, and a range of 0V to 4.1V, then 12-bit resolution would not be adequate.

**Step 1:** Calculate the resolution needed:

$4.1V/1 \mu V = 4.1 \times 10^6$ . Since  $2^{22} = 4.2 \times 10^6$ , 22-bit resolution is desired. Since  $DNL = \pm 0.75 \text{ LSB}$ , this design can be done with the 12-bit MCP4822 DAC.

**Step 2:** Since DAC<sub>B</sub>'s V<sub>OUTB</sub> has a resolution of 1 mV, its output only needs to be “pulled” 1/1000 to meet the 1 μV target. Dividing V<sub>OUTA</sub> by 1000 would allow the application to compensate for DAC<sub>B</sub>'s DNL error.

**Step 3:** If R<sub>2</sub> is 100Ω, then R<sub>1</sub> needs to be 100 kΩ.

**Step 4:** The resulting transfer function is shown in the equation of Example 6-5.

### EXAMPLE 6-5: SIMPLE, DOUBLE-PRECISION DAC WITH MCP4822

## 6.9 Building Programmable Current Source

**Example 6-6** shows an example of building a programmable current source using a voltage follower. The current sensor (sensor resistor) is used to convert the DAC voltage output into a digitally-selectable current source.

Adding the resistor network from **Example 6-2** would be advantageous in this application. The smaller  $R_{SENSE}$  is, the less power dissipated across it.

However, this also reduces the resolution that the current can be controlled with. The voltage divider, or “window”, DAC configuration would allow the range to be reduced, thus increasing resolution around the range of interest. When working with very small sensor voltages, plan on eliminating the amplifier’s offset error by storing the DAC’s setting under known sensor conditions.

### EXAMPLE 6-6: DIGITALLY-CONTROLLED CURRENT SOURCE

# MCP4802/4812/4822

NOTES:

## 8.0 PACKAGING INFORMATION

### 8.1 Package Marking Information

8-Lead MSOP (3x3 mm)

Example

8-Lead PDIP (300 mil)

Example

8-Lead SOIC (3.90 mm)

Example

<b>Legend:</b>	XX...X	Customer-specific information
	Y	Year code (last digit of calendar year)
	YY	Year code (last 2 digits of calendar year)
	WW	Week code (week of January 1 is week '01')
	NNN	Alphanumeric traceability code
	(e3)	Pb-free JEDEC designator for Matte Tin (Sn)
	*	This package is Pb-free. The Pb-free JEDEC designator (e3) can be found on the outer packaging for this package.

**Note:** In the event the full Microchip part number cannot be marked on one line, it will be carried over to the next line, thus limiting the number of available characters for customer-specific information.

NOTES:

---

**Note the following details of the code protection feature on Microchip devices:**

- Microchip products meet the specification contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip's Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.
- Microchip is willing to work with the customer who is concerned about the integrity of their code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as “unbreakable.”

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip's code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.

**QUALITY MANAGEMENT SYSTEM**  
**CERTIFIED BY DNV**  
**== ISO/TS 16949 ==**

*Microchip received ISO/TS-16949:2009 certification for its worldwide headquarters, design and wafer fabrication facilities in Chandler and Tempe, Arizona; Gresham, Oregon and design centers in California and India. The Company's quality system processes and procedures are for its PIC® MCUs and dsPIC® DSCs, KEELOQ® code hopping devices, Serial EEPROMs, microperipherals, nonvolatile memory and analog products. In addition, Microchip's quality system for the design and manufacture of development systems is ISO 9001:2000 certified.*
