ERB Product Summary

ERB Series: Exhibiting a capacitance range of 0.5 to 1,000pF, the ERB series of capacitors comes with higher Q and lower ESR which is better than the standard products of equivalent packages. For high performance, medium power RF designs, this series offers low ESR in the 1MHz to 1GHz frequency range. The temperature stability of the C0G dielectrics ensures low power dissipation. The ERB series is designed with precious metal inner electrodes. These surface mount capacitors are available in voltages up to 500VDC in a 1210 EIA size.

Features:

- Size: 0603, 0805, and 1210
- Voltage: 50, 100, 250, 300, 500VDC
- Cap Range: 0.5 to 1000pF
- Internal Electrode: Pd/Ag
- Termination: Pd/Ag + Ni/Sn plating
- ESR: Low
- Power: Medium Power (5-15W)
- Frequency Range: 1MHz –1GHz
- Tolerance: Tight Tolerance Available ([W]=+/-0.05pF for <=5pF, [[B]=+/-0.1pF for 5 - 9.1pF, [C]=+/-0.25pF for 5 - 9.1pF, [F]=+/-1% for 10 - 20pF)
- Temp. Characteristics: C0G (-55°C to 125°C with 0 ±30ppm/°C)

Applications: General purpose high frequency circuits, wireless equipment, high frequency radios, broadcast satellites, terminals, RF and base station power amplifiers

ERB Specifications and Test Methods

Item	Specifications	Test Method
Operating Temperature	- 55°C to 125°C	Reference Temperature: 25°C
Appearance	No defects or abnormalities.	Visual inspection.
Dimension	Within the specified dimensions.	Using calipers.
Dielectric Strength	No defects or abnormalities.	300%* of the rated voltage *250V/300V: 250%, 500V: 200%
Insulation Resistance	1,000,000MΩmin.(C≦470pF) 100,000 MΩmin. (C > 470pF) C: Nominal capacitance (pF)	DC voltage not exceeding the rated voltage at 25°C and 75%RH max. and within 2 minutes of charging.
Q	C≦220pF: Q≧10,000 220pF < C≦470pF: Q≧5,000 470pF < C≦1000pF: Q≧3,000 C: Nominal capacitance (pF)	Frequency 1±0.1MHz Voltage 1±0.2Vrms
Capacitance Temperature Characteristics	Capacitance Change: Within the specified tolerance. (Table A-1) Temperature Coefficent: Within the specified tolerance. (Table A-1) Capacitance Drift: Within ±0.2% or ±0.5pF (Whichever is larger)	The temperature coefficient is determined using the capacitance measured in step 3 as a reference. When cycling the temperature sequentially from step 1 through 5 the capacitance should be within the specified tolerance for the temperature coefficient and capacitance change as in Table A-1. The capacitance drift is calculated by dividing the differences between the maximum and minimum measured values in steps 1, 3 and 5 by the cap. value in step 3.
Adhesive Strength of Termination	No removal of the terminations or other defect should occur.	Solder the capacitor to the test jig (glass epoxy board) then apply 10N force in parallel with the test jig for 10±1sec.
Vibration Resistance	Appearance: No defects or abnormalities. Capacitance: Within the specified tolerance. C≦220pF: Q≧10,000 220pF < C≦470pF: Q≧5,000 470pF < C≦1000pF: Q≧3,000 C: Nominal capacitance (pF)	Frequency range, from 10 to 55Hz and return to 10Hz, should be traversed in approximately 1 minute. This motion should be applied for a period of 2 hours in each of 3 mutually perpendicular directions total of 6 hours).
Deflection	No crack or marked defect should occur.	Flexure: 1mm
Solderability of Termination	95% of the terminations are to be soldered evenly and continuously.	Immerse in eutectic solder solution for 5±0.5 seconds at 245±5°C or Sn-3.0Ag-0.5Cu solder solution for 5±0.5 seconds at 245±5°C.
Resistance to Soldering Heat	Appearance: No marking defects Capacitance Change: Within ±2.5% or ±0.25 pF (Whichever is larger) C≦220pF: Q≧10,000 220pF < C≦470pF: Q≧5,000 470pF < C≦1000pF: Q≧3,000 C: Nominal capacitance (pF)	Immerse the capacitor in a eutectic solder solution or Sn-3.0Ag-0.5Cu solder solution at 270±5°C for 10±0.5 seconds. Let sit at room temperature for 24±2 hours.
Temperature Cycle	Appearance: No marking defects Capacitance Change: Within ±5% or ±0.5 pF (Whichever is larger) C≦220pF: Q≧10,000 220pF < C≦470pF: Q≧5,000 470pF < C≦1000pF: Q≧3,000 C: Nominal capacitance (pF)	- 55°C to 125°C Five cycles

Step	Temperature (°C)
1	25±2
2	-55±3
3	25±2
4	125±3
5	25±2

ERB Specifications and Test Methods

Item	Specification	Test Method
Humidity Steady State	Appearance: No marking defects Capacitance Change: Within ±5% or ±0.5 pF (Whichever is larger) C≦30pF: Q ≧350, 10pF≦C<30pF: Q≧275+5°C/2C<10pF:Q ≧200+10C C: Nominal Capacitance (puff)	Apply the 24-hour heat (-10 to +65°C) and humidity (80 to 100%) treatment, 10 consecutive times.
High Temperature Load	Appearance: No marking defects Capacitance Change Within ±3% or ±0.3pF (Whichever is larger) C≦30pFmin≧Q350 10pF≦C<30pF: Q≧275+5C/2C <10pF: Q ≧200+10C C: Nominal Capacitance (pF)	Apply 200% (500V only 150%) of the rated voltage for 1000±12 hours at the maximum operating temperature ±3°C.

Table A-1

Char.	Nominal Values (ppm/°C) Note	Capacitance Change from 25°C (%)					
		−55C		−30C		−10C	
		Max.	Min.	Max.	Min.	Max.	Min.
5C	0 ± 30	0.58	-0.24	0.4C	-0.17	0.25	-0.11

Note: Nominal values denote the temperature coefficient within a range of 25°C to 125°C.

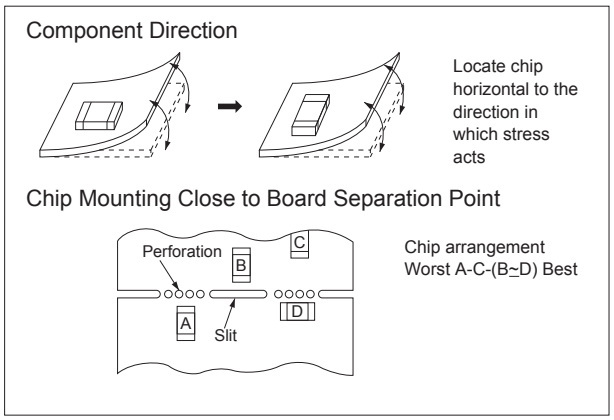
ERB Soldering and Mounting

■ ⚠Caution (Soldering and Mounting)

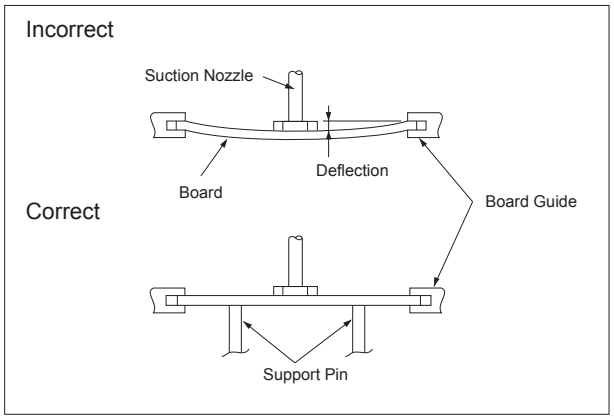
1. Mounting Position

Choose a mounting position that minimizes the stress imposed on the chip during flexing or bending of the board.



2. Chip Placing

- An excessively low bottom dead point of the suction nozzle imposes great force on the chip during mounting, causing cracked chips. So adjust the suction nozzle's bottom dead point by correcting warp in the board. Normally, the suction nozzle's bottom dead point must be set on the upper surface of the board. Nozzle pressure for chip mounting must be a 1 to 3N static load.
- Dirt particles and dust accumulated between the suction nozzle and the cylinder inner wall prevent the nozzle from moving smoothly. This imposes great force on the chip during mounting, causing cracked chips. And the locating claw, when worn out, imposes uneven forces on the chip when positioning, causing cracked chips. The suction nozzle and the locating claw must be maintained, checked and replaced periodically.



Continued on the following page.

ERB Soldering and Mounting

3. Reflow Soldering

- When sudden heat is applied to the components, the mechanical strength of the components should go down because remarkable temperature change causes deformity inside components. In order to prevent mechanical damage in the components, preheating should be required for both of the components and the PCB board. Preheating conditions are shown in Table 1. It is required to keep temperature differential between the soldering and the components surface (ΔT) as small as possible.
- Solderability of Tin plating termination chip might be deteriorated when low temperature soldering profile where peak solder temperature is below the Tin melting point is used. Please confirm the solderability of Tin plating termination chip before use.
- When components are immersed in solvent after mounting, be sure to maintain the temperature difference (ΔT) between the component and solvent within the range shown in the Table 1.

Table 1

Part Number	Temperature Differential
ERB18/21	ΔT≦190℃
ERB32	ΔT≦130℃

Recommended Conditions

	Pb-Sn Solder		Lead Free Solder
	Infrared Reflow	Vapor Reflow	
Peak Temperature	230-250°C	230-240°C	240-260°C
Atmosphere	Air	Air	Air or N_2

Pb-Sn Solder: Sn-37Pb
Lead Free Solder: Sn-3.0Ag-0.5Cu

4. Optimum Solder Amount for Reflow Soldering

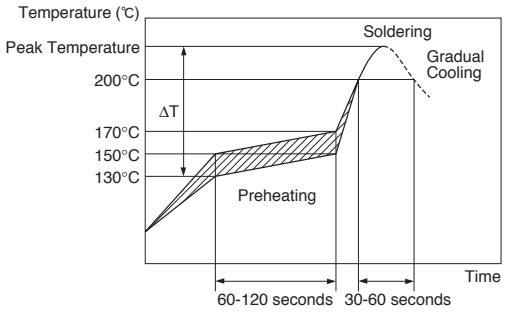
- Overly thick application of solder paste results in excessive fillet height solder.
  This makes the chip more susceptible to mechanical and thermal stress on the board and may cause cracked chips.
- Too little solder paste results in a lack of adhesive strength on the outer electrode, which may result in chips breaking loose from the PCB.
- Make sure the solder has been applied smoothly to the end surface to a height of 0.2mm min.

Inverting the PCB

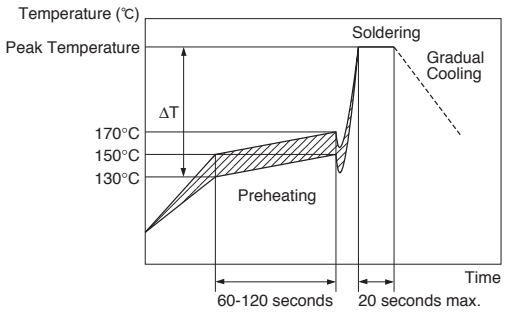
Make sure not to impose an abnormal mechanical shock on the PCB.

Standard Conditions for Reflow Soldering

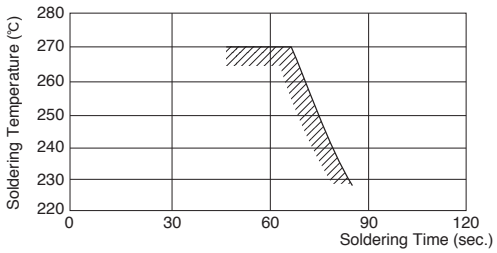
Infrared Reflow



Vapor Reflow

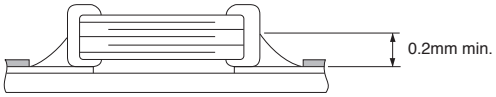


Allowable Soldering Temperature and Time



In case of repeated soldering, the accumulated soldering time must be within the range shown above.

Optimum Solder Amount for Reflow Soldering



Continued on the following page.

ERB Soldering and Mounting

5. Flow Soldering

- When sudden heat is applied to the components, the mechanical strength of the components should go down because remarkable temperature change causes deformity inside components. And an excessively long soldering time or high soldering temperature results in leaching of the outer electrodes, causing poor adhesion or a reduction in capacitance value due to loss of contact between electrodes and end termination.
- In order to prevent mechanical damage in the components, preheating shoud be required for the both components and the PCB board. Preheating conditions are shown in Table 2. It is required to keep temperature differential between the soldering and the components surface (ΔT) as small as possible.
  When components are immersed in solvent after mounting, be sure to maintain the temperature difference between the component and solvent within the range shown in Table 2.
  Do not apply flow soldering to chips not listed in Table 2.

Table 2

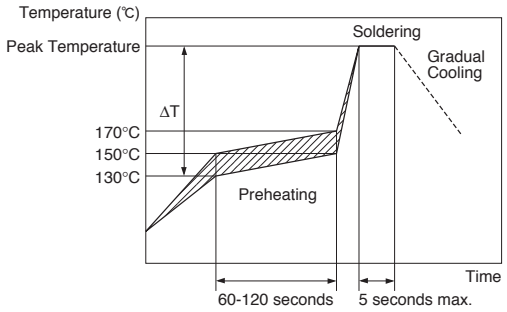
Part Number	Temperature Differential
ERB18/21	ΔT≦150℃

Recommended Conditions

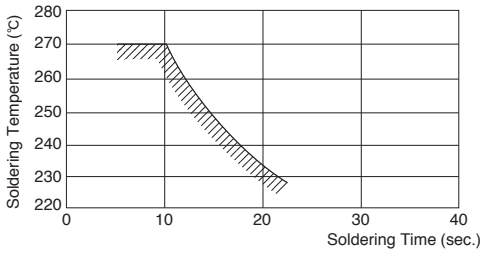
	Pb-Sn Solder	Lead Free Solder
Peak Temperature	240-250°C	250-260°C
Atmosphere	Air	N_2

Pb-Sn Solder: Sn-37Pb
Lead Free Solder: Sn-3.0Ag-0.5Cu

Standard Conditions for Flow Soldering

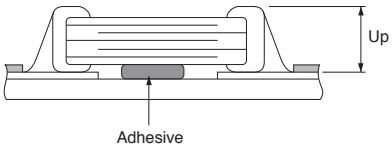


Allowable Soldering Temperature and Time



In case of repeated soldering, the accumulated soldering time must be within the range shown above.

- Optimum Solder Amount for Flow Soldering
  The top of the solder fillet should be lower than the thickness of components. If the solder amount is excessively big, the risk of cracking is higher during board bending or under any other stressful conditions.



Continued on the following page.

ERB Soldering and Mounting

6. Correction with a Soldering Iron

(1) For Chip Type Capacitors

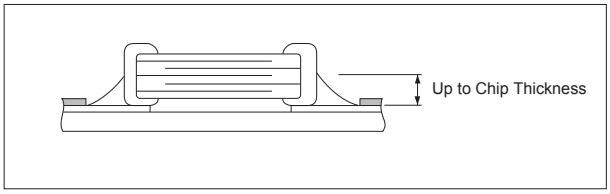
- When sudden heat is applied to the components by soldering iron, the mechanical strength of the components should go down because remarkable temperature change causes deformity inside components. In order to prevent mechanical damage in the components, preheating should be required for both of the components and the PCB board. Preheating conditions are shown in Table 3. It is required to keep temperature differential between the soldering and the components surface (ΔT) as small as possible. After soldering, it is not allowed to cool it down rapidly.

Table 3

Part Number	Temperature Differential	Peak Temperature	Atmosphere
ERB18/21	ΔT≦190℃	300°C max. 3 seconds max. / termination	Air
ERB32	ΔT≦130℃	270°C max. 3 seconds max. / termination	Air

*Applicable for both Pb-Sn and Lead Free Solder.
Pb-Sn Solder: Sn-37Pb
Lead Free Solder: Sn-3.0Ag-0.5Cu

- Optimum Solder Amount when Corrections Are Made Using a Soldering Iron
  The top of the solder fillet should be lower than the thickness of components. If the solder amount is excessively big, the risk of cracking is higher during board bending or under any other stressful conditions. Soldering iron ø3mm or smaller should be required. And it is necessary to keep a distance between the soldering iron and the components without direct touch. Thread solder with ø0.5mm or smaller is required for soldering.



7. Washing

Excessive output of ultrasonic oscillation during cleaning causes PCBs to resonate, resulting in cracked chips or broken solder. Take note not to vibrate PCBs.

FAILURE TO FOLLOW THE ABOVE CAUTIONS MAY RESULT, WORST CASE, IN A SHORT CIRCUIT AND FUMING WHEN THE PRODUCT IS USED.

ERB Design Engineering Kits

CERAMIC CHIP CAPACITORS

ASCAP Hi-Frequency

- Miniature sizes & stable C0G temperature coefficient
- Very high Q at high frequencies
- 0603, 0805 and 1210 sizes
- Low Power Consumption for Mobile Telecommunication
- Base Station, Terminal applications, Wireless equipment and High frequency radio
