Operational Amplifier, Rail-to-Rail Output, 3 MHz BW

The NCx2007x series operational amplifiers provide rail−to−rail output operation, 3 MHz bandwidth, and are available in single, dual, and quad configurations. Rail−to−rail operation enables the user to make optimal use of the entire supply voltage range while taking advantage of 3 MHz bandwidth. The NCx2007x can operate on supply voltages as low as 2.7 V over the temperature range of −40°C to 125°C. At a 2.7 V supply, the high bandwidth provides a slew rate of 2.8 V/μs while only consuming 405 μA of quiescent current per channel. The wide supply range allows the NCx2007x to run on supply voltages as high as 36 V, making it ideal for a broad range of applications. Since this is a CMOS device, high input impedance and low bias currents make it ideal for interfacing to a wide variety of signal sensors. The NCx2007x devices are available in a variety of compact packages. Automotive qualified options are available under the NCV prefix.

APPLICATIONS INFORMATION

Input Circuit

The NCS2007x input stage has a PMOS input pair and ESD protection diodes. The input pair is internally connected by back−to−back Zener diodes with a reverse voltage of 5.5 V. To protect the internal circuitry, the input current must be limited to 10 mA. When operating the NCS2007x at differential voltages greater than V_{ID} = 26 V, series resistors can be added externally to limit the input current flowing between the input pins. Adding 500 Ω resistors in series with the input prevents the current from exceeding 10 mA over the entire operating range up to 36 V.

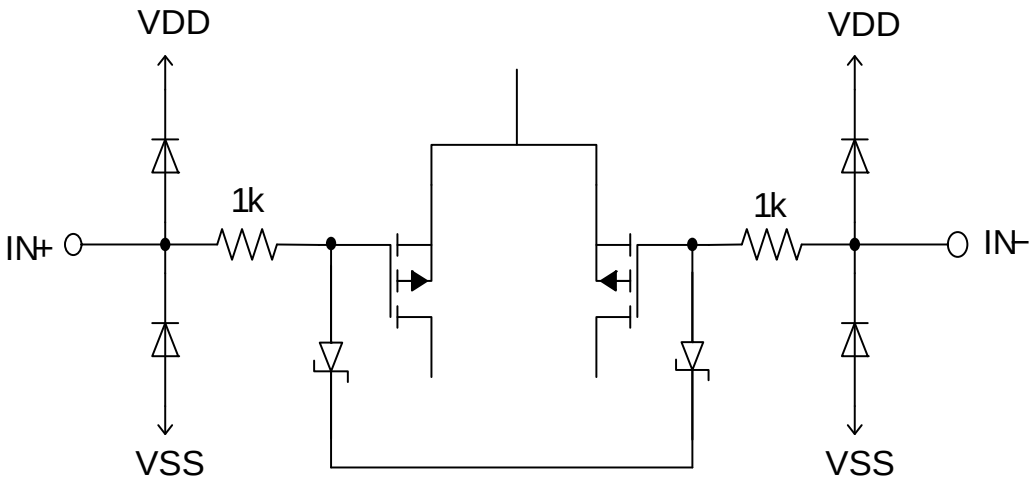

Figure 29. Differential Input Pair

Output

The NCS2007x has a class AB output stage with rail−to−rail output swing.

High output currents can cause the junction temperature to exceed the 150°C absolute maximum rating. In the case of a short circuit where the output is connected to either supply rail, the amount of current the op amp can source and sink is described by the output current capability parameter listed in the Electrical Characteristics. The junction temperature at a given power dissipation, P, can be calculated using the following formula:

$T_J = T_A + P \times \theta_{JA}$

The thermal resistance between junction and ambient, θ_{JA}, is provided in the Thermal Information section of this datasheet.
