# P-Channel Enhancement Mode Field-Effect Transistor

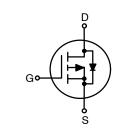

# **BSS84**

#### **General Description**

This P-channel enhancement-mode field-effect transistor is produced using **onsemi's** proprietary, high cell density, DMOS technology. This very high density process minimizes on-state resistance and to provide rugged and reliable performance and fast switching. The BSS84 can be used, with a minimum of effort, in most applications requiring up to 0.13 A DC and can deliver current up to 0.52 A. This product is particularly suited to low-voltage applications requiring a low-current high-side switch.

#### Features

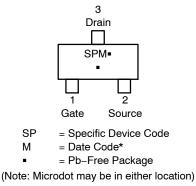

- $-0.13 \text{ A}, -50 \text{ V}, \text{R}_{\text{DS(on)}} = 10 \Omega \text{ at } \text{V}_{\text{GS}} = -5 \text{ V}$
- Voltage-Controlled P-Channel Small-Signal Switch
- High-Density Cell Design for Low RDS(on)
- High Saturation Current
- This Device is Pb–Free and Halogen Free

Product parametric performance is indicated in the Electrical Characteristics for the listed test conditions, unless otherwise noted. Product performance may not be indicated by the Electrical Characteristics if operated under different conditions.

1.  $R_{\theta JA}$  is the sum of the junction-to-case and case-to-ambient thermal resistance where the case thermal reference is defined as the solder mounting surface of the drain pins.  $R_{\theta JA}$  is guaranteed by design while  $R_{\theta JA}$  is determined by the user's board design.
