To: DIGI-KEY CORPORATION

Issue No.	: A-NHG-EM-187
Date of Issue	: September 29, 2020
Classification	: New , Changed

PRODUCT SPECIFICATION FOR APPROVAL

Product Description : Aluminum Electrolytic Capacitor
Customer Part Number :

Product Part Number : ECA2CHG010

Country of Origin : Malaysia (Printed on the packaging label)
Applications : COMPONENT OTHERS

※ If you approve this specification, please fill in and sign the below and return 1copy to us.

Approval No :

Notice

◆ Law and regulation which are applied

- This product complies with the RoHS Directive (Restriction of the use of certain Hazardous Substances in electrical and electronic equipment (DIRECTIVE 2011/65/EU and（EU)2015/863).
- No Ozone Depleting Chemicals(ODC's), controlled under the Montreal Protocol Agreement, are used in producing this product.
- We do not PBBs or PBDEs as brominated flame retardants.
- Export procedure which followed export related regulations, such as foreign exchange and a foreign trade method, on the occasion of export of this product. Thank you for your consideration.

◆ Usage limitation

- This capacitor is designed to be used for electronics circuits such as audio/visual equipment, home appliances, computers and other office equipment, optical equipment, measuring equipment. When using for purposes which requires high reliability and safety, in cases such as when incorrect operation of this product may do harm to human life or property, delivery specifications suitable for such uses must be exchanged separately.

◆ Intellectual property rights and licenses

- The technical information in this specification provides examples of our products' typical operations and application circuits. We do not guarantee the non-infringement of third party's intellectual property rights and we do not grant any license, right, or interest in our intellectual property.

◆ Contents of Specifications

- This Product Specification is the only binding description of the specifications of this product, and shall always supersede and take precedence over any other written or oral information (including by email) communicated at any time between your company and our company, whether before or after the date of this Product Specification.
  Any additions, deletions, or modifications to the specifications of this product shall be invalid, null and void unless a revised Product Specification is executed by both parties.

◆ Handling of specifications

- If you approve this specification, please fill in and sign below and return 1 copy to us within 60 days.
  If the signed specification is not returned to us within 6 months from issue date of this specification, we will consider that you have approved this specification.

◆ Unless otherwise specified, the product shall conform to JIS C5101-4-1

◆ Country of origin : MALAYSIA

◆ Manufacturing factory : Panasonic Industrial Devices Malaysia Sdn. Bhd.
No.1 Jalan Jemuju 16/13,40200 Shah Alam, Selangor Darul Ehsan, MALAYSIA

1. Scope

Fixed capacitors for use in electronic equipment, Aluminum electrolytic capacitors with non-solid electrolyte.

2. Parts Number

E C	A	2C	HG	010	☐
2-1	2-2	2-3	2-4	2-5	2-6

2-1 Aluminum Electrolytic Capacitor

2-2 Type : Radial lead type (JIS : 04 type)

2-3 Rated Voltage Code

Voltage Code	2C
Rated Voltage (V.DC)	160

2-4 NHG series

2-5 Capacitance Code: Indicating capacitance in uF by 3 letters.
The first 2 figures are actual values and the third denotes the number of zeros.
"R" denotes the decimal point and all figures are the actual number with "R".
For example, 1uF is expressed as 010 in this case.

ex. 2.2μF → 2R2, 10μF → 100, 1000μF → 102

2-6 Suffix Code for Appearance: Special Code for Appearance

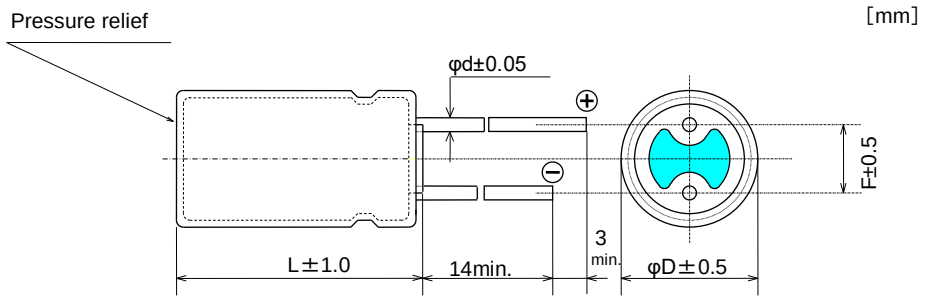
Blank	Standard Long Lead

Parts list

	Part No.	W.V. [V.DC]	Cap. [μF] (120Hz) (20℃)	Tangent of loss angle max. (120Hz) (20℃)	Leakage Current [μA] max. (After 2 min)	Rated Ripple Current [mA rms] max. (120Hz) (105℃)	Dim. [mm]		
							φD	L	φd
	ECA2CHG010	160	1	0.15	19.6	17.0	6.3	11.2	0.5

3. Dimensions and Appearance

Body Color(Black), Marking(Silver)
Standard Long Lead (Suffix: Blank)



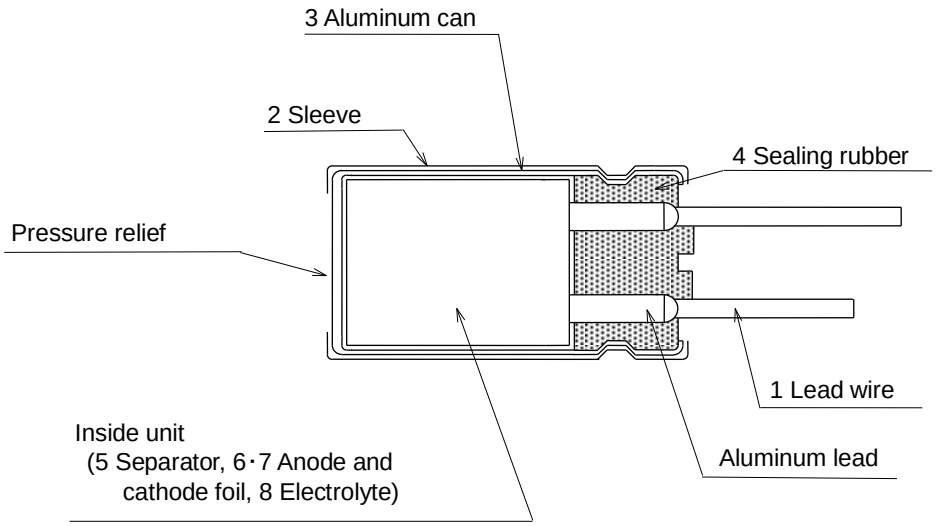
[mm]

Body Dia. φD	6.3
Lead Space F	2.5
Lead Dia. φd	0.5

Please refer to L dimension on the parts number lists table.

4. Constructions

4-1 Inside Construction



4-2 Construction Parts

	Parts	Materials		Parts	Materials
1	Lead Wire	Solid tinned copper weld steel wire	5	Separator	Cellulose
2	Sleeve	Thermoplastic Resin	6	Anode Foil	High purity Aluminum foil
3	Aluminum Can	Aluminum	7	Cathode Foil	Aluminum foil
4	Sealing Rubber	Synthetic rubber (EPT/IIR)	8	Electrolyte	Organic Solvent , Organic Acid (No Quaternary Salt)

5. Marking

Markings indicated on the products :

a) Rated Voltage.
b) Capacitance
c) Negative Polarity
d) Manufacturer's Trademark
e) Upper Category Temperature
f) Series Code
g) Lot No. (It indicates to Lot No. System)

Lot No. System

Lot number is indicated on a sleeve in following manner.
eg. For 04 type, expressed in 4 figures, 5 figures or 6 figures.

(a)	(b)	(c)	(d)

As for the display contents of 4 figures, there are 2 kinds

(1)
- (a) last number of year
- (b) month (1 to 9 and O for October, N for November, D for December)
- (c) production date (A to Z and 1 to 5)
- (d) line code in alphabet (A to Z)

(2)
- (a) line code in alphabet (A to Z)
- (b) production date (A to Z and 1 to 5)
- (c) month (1 to 9 and O for October, N for November, D for December)
- (d) last number of year

(a)	(b)	(c)
(d)	(d)	

- (a) last number of year
- (b) month (1 to 9 and O for October, N for November, D for December)
- (c) week (Greece number)
- (d) line code in alphabet (A to Z)

(a)	(b)	(c)	(d)	(d)

- (a) last number of year
- (b) month (1 to 9 and O for October, N for November, D for December)
- (c) week (Greece number) or production date (1 to 9 expression)
- (d) line code in alphabet (A to Z)

(a)	(b)	(c)	(c)
	(d)	(d)	

- (a) last number of year
- (b) month (1 to 9 and O for October, N for November, D for December)
- (c) production date (01 to 31 expression)
- (d) line code in alphabet (A to Z)

(a)	(b)	(c)	(c)	(d)	(d)

- (a) last number of year
- (b) month (1 to 9 and O for October, N for November, D for December)
- (c) production date (01 to 31 expression)
- (d) line code in alphabet (A to Z)

production year	production month		production week	production date	
6: 2016	1:January	7:July	Ⅰ: first week	01:1date	A:1 date
7: 2017	2:February	8:August	Ⅱ:second week	02:2date	B:2 date
8: 2018	3:March	9:September	Ⅲ: third week	03:3date	≀
9: 2019	4:April	O:October	Ⅳ: forth week	≀	Z:26 date
0: 2020	5:May	N:November	Ⅴ: fifth week	30:30date	1:27 date
	6:June	D:December		31:31date	2:28 date
Indicating with the last digit or the last 1 digits of a year.					≀ 5:31 date

* Lot number can be written in both horizontal and vertical directions.

6. Standard Ratings

No.	Item	Ratings		
1	Category Temperature Range	-25℃ ～ +105℃		
2	Rated Voltage Range	160 V.DC		
3	Capacitance Range	1 μF (120Hz 20℃)		
4	Capacitance Tolerance	± 20% (120Hz 20℃)		
5	Surge Voltage (V.DC)	R.V.	160	
		S.V.	200	
6	Rated Ripple Current	Parts Lists and Table 2

* This specification guarantees the quality and performance of the product as individual components.
The durability differs depending on the environment and the conditions of usage.
Before use, check and evaluate their compatibility with actual conditions when installed in the products.
When safety requirements cannot be satisfied in your technical examination, inform us immediately.
* Do not use the products beyond the specifications described in this document.
* Install the following systems for a failsafe design to ensure safety if these products are to be used in equipment where a defect in these products may cause the loss of human life or other signification damage, such as damage to vehicles (automobile, train, vessel), traffic lights, medical equipment, aerospace equipment, electric heating appliances, combustion/ gas equipment, rotating equipment, and disaster/crime prevention equipment.
  - The system is equipped with a protection circuit and protection device.
  - The system is equipped with a redundant circuit or other system to prevent an unsafe status in the event of a single fault.
* Before using the products, carefully check the effects on their quality and performance, and determined whether or not they can be used.
These products are designed and manufactured for general-purpose and standard use in general electronic equipment.
These products are not intended for use in the following special conditions.
  1. In liquid, such as Water, Oil, Chemicals, or Organic solvent
  2. In direct sunlight, outdoors, or in dust
  3. In vapor, such as dew condensation water of resistive element, or water leakage, salty air, or air with a high concentration corrosive gas, such as Cl_2, H_2S, NH_3, SO_2, or NO_X
  4. In an environment where strong static electricity or electromagnetic waves exist
  5. Mounting or placing heat-generating components or inflammables, such as vinyl-coated wires, near these products
  6. Sealing or coating of these products or a printed circuit board on which these products are mounted, with resin and other material
  7. Using resolvent, water or water-soluble cleaner for flux cleaning agent after soldering.
  (In particular, when using water or a water-soluble cleaning agent, be careful not to leave water residues)
  8. Using in the atmosphere where strays Acid or alkaline.
  9. Using in the atmosphere where there are excessive vibration and shock.
  10. Using in the atmosphere where there are low pressure or decompression.
* Please arrange circuit design for preventing impulse or transitional voltage.
Do not apply voltage, which exceeds the full rated voltage when the capacitors receive impulse voltage, instantaneous high voltage, high pulse voltage etc.
* Electrolyte is used in the products. Therefore, misuse can result in rapid deterioration of characteristics and functions of each product.
Electrolyte leakage damages printed circuit and affects performance, characteristics, and functions of customer system.

1. Circuit Design

1.1 Operating Temperature and Frequency

Electrical parameters for electrolytic capacitors are normally specified at 20℃ temperature and 120 Hz frequency.
These parameters vary with changes in temperature and frequency. Circuit designers should take these changes into consideration.

(1) Effects of operating temperature on electrical parameters
  a) At higher temperatures, leakage current and capacitance increase while equivalent series resistance (ESR) decreases.
  b) At lower temperatures, leakage current and capacitance decrease while equivalent series resistance (ESR) increases.

(2) Effects of frequency on electrical parameters
  a) At higher frequencies, capacitance and impedance decrease while tan δ increases.
  b) At lower frequencies, heat generated by ripple current will rise due to an increase in equivalent series resistance (ESR).

1.2 Operating Temperature and Life Expectancy

(1) Expected life is affected by operating temperature. Generally, each 10 ℃ reduction in temperature will double the expected life.
Use capacitors at the lowest possible temperature below the upper category temperature.

(2) If operating temperatures exceed the upper category limit, rapid deterioration of electrical parameter will occur and irreversible damage will result.
Check for the maximum capacitor operating temperatures including ambient temperature, internal capacitor temperature rise due to ripple current, and the effects of radiated heat from power transistors, IC's or resistors.
Avoid placing components, which could conduct heat to the capacitor from the back side of the circuit board.

(3) The formula for calculating expected life at lower operating temperatures is as follows ;

$$L_2 = L_1 \times 2^{\frac{T_1 - T_2}{10}}$$

L_1 : Guaranteed life (h) at temperature, T_1 ℃
L_2 : Expected life (h) at temperature, T_2 ℃
T_1 : Upper category temperature (℃) + temperature rise due to rated ripple current heating(℃)
T_2 : Actual operating temperature, ambient temperature + temperature rise due to ripple current heating(℃)

(4) Please use according to the lifetime as noted in this specification. Using products beyond end of the lifetime may change characteristics rapidly, short-circuit, operate pressure relief vent, or leak electrolyte.

1.3 Common Application Conditions to Avoid

The following misapplication load conditions will cause rapid deterioration of a capacitor's electrical parameters.
In addition, rapid heating and gas generation within the capacitor can occur, causing the pressure relief vent to operate and resultant leakage of electrolyte. Under extreme conditions, explosion and fire ignition could result.
The leaked electrolyte is combustible and electrically conductive.

(1) Reverse Voltage

DC capacitors have polarity. Verify correct polarity before insertion. For circuits with changing or uncertain polarity, use DC bipolar capacitors. DC bipolar capacitors are not suitable for use in AC circuits.

(2) Charge / Discharge Applications

Standard capacitors are not suitable for use in repeating charge/discharge applications. For charge/ discharge applications, consult us with your actual application condition.
For rush current, please to not exceed 100A.

(3) ON-OFF circuit

Do not use capacitors in circuit where ON-OFF switching is repeated more than 10000 times/per day.
In case of applying to the theses ON-OFF circuit, consult with us about circuit condition and so on.

(4) Over voltage

Do not apply voltages exceeding the maximum specified rated voltage. Voltages up to the surge voltage rating are acceptable for short periods of time.
Ensure that the sum of the DC voltage and the superimposed AC ripple voltage does not exceed the rated voltage.

(5) Ripple Current

Do not apply ripple currents exceeding the maximum specified value. For high ripple current applications, use a capacitor designed for high ripple currents. In addition, consult us if the applied ripple current is to be higher than the maximum specified value.
Ensure that rated ripple currents that superimposed on low DC bias voltages do not cause reverse voltage conditions.

1.4 Using Two or More Capacitors in Series or Parallel

(1) Capacitors Connected in Parallel

The circuit resistance can closely approximate the series resistance of the capacitor, causing an imbalance of ripple current loads within the capacitors. Careful wiring methods can minimize the possible application of an excessive ripple current to a capacitor.

(2) Capacitors Connected in Series

Differences in normal DC leakage current among capacitors can cause voltage imbalances.
The use of voltage divider shunt resistors with consideration to leakage currents can prevent capacitor voltage imbalances.

1.5 Capacitor Mounting Considerations

(1) Double-Sided Circuit Boards

Avoid wiring pattern runs, which pass between the mounted capacitor and the circuit board. When dipping into a solder bath, an excess solder may deposit under the capacitor by capillary action, causing short circuit between anode and cathode terminals.

(2) Circuit Board Hole Positioning

The vinyl sleeve of the capacitor can be damaged if solder passes through a lead hole into the subsequently processed parts.
Special care when locating hole positions in proximity to capacitors is recommended.

(3) Circuit Board Hole Spacing

The spacing of circuit board holes should match the lead wire spacing of capacitors within the specified tolerances.
Incorrect spacing can cause an excessive lead wire stress during the insertion process.
This may result in premature capacitor failure due to the short or open circuit, increased leakage current, or electrolyte leakage.

(4) Clearance for Case Mounted Pressure Relief

Capacitors with case mounted pressure relief require sufficient clearance to allow proper pressure relief operation.
The minimum clearances are dependent of capacitor diameters as follows.
(Dia. 6. 3 mm ～Dia. 16 mm : 2 mm minimum, Dia. 18 mm ～Dia. 35 mm : 3 mm minimum, Dia 40 mm or greater : 5 mm minimum.)

(5) Clearance for Seal Mounted Pressure Relief

Provide a hole on a circuit board to relieve gas when a pressure relief of a capacitor is situated underneath of the circuit board.

(6) Wiring Near the Pressure Relief

Avoid locating high voltage, high current wiring, or circuit board paths above the pressure relief .
Flammable, high temperature gas that exceeds 100 ℃ may be released and could dissolve the wire insulation and ignite.

(7) Circuit Board Patterns Under the Capacitor

Avoid circuit board runs underneath the capacitor, as an electrical short can occur due to an electrolyte leakage.

(8) Screw Terminal Capacitor Mounting

Do not orient the capacitor with the screw terminal side of the capacitor facing downward.
Tighten the terminal and mounting bracket screws within the torque range specified in the specification.

1.6 Electrical Isolation of the Capacitor

Completely isolate the capacitor as follows.
(1) Between the cathode and the case (except for axially leaded B types) and between the anode terminal and other circuit paths.
(2) Between the extra mounting terminals (on T types) and the anode terminal, cathode terminal, and other circuit paths.

1.7 Capacitor Sleeve

The vinyl sleeve or laminate coating is intended for marking and identification purposes and is not meant to electrically insulate the capacitor.
The sleeve may split or crack if immersed into solvents such as toluene or xylene and then subsequently exposed to high temperatures.

2. Capacitor Handling Techniques

2.1 Considerations Before Using

(1) Capacitors have a finite life. Do not reuse or recycle capacitors from used equipment.
(2) Transient recovery voltage may be generated in the capacitor due to dielectric absorption.
If required, this voltage can be discharged with a resistor with a value of about 1kΩ.
(3) Capacitors stored for a long period of time may exhibit an increase in leakage current.
This can be corrected by gradually applying rated voltage in series with a resistor of approximately 1kΩ.
(4) If capacitors are dropped, they can be damaged mechanically or electrically. Avoid using dropped capacitors.
(5) Dented or crushed capacitors should not be used. The seal integrity can be damaged and loss of electrolyte/shortened life can result.

2.2 Capacitor Insertion

(1) Verify the correct capacitance and rated voltage of the capacitor.
(2) Verify the correct polarity of the capacitor before insertion.
(3) Verify the correct hole spacing before insertion (land pattern size on chip type) to avoid stress on the terminals.
(4) Ensure that the lead clinching operation done by auto insertion equipments does not stress the capacitor leads where they enter the seal of the capacitor.
For chip type capacitors, excessive mounting pressure can cause high leakage current, short circuit, or disconnection.

2.3 Manual Soldering

(1) Apply soldering conditions (temperature and time) based on the specification, or do not exceed temperature of 350 ℃ for 3 seconds or less.
(2) If lead wires must be modified to meet terminal board hole spacing, avoid stress on the lead wire where it enters the capacitor seal.
(3) If a soldered capacitor must be removed and reinserted, avoid excessive stress on the capacitor leads.
(4) Avoid physical contacts between the tip of the soldering iron and capacitors to prevent melting of the vinyl sleeve.

2.4 Flow Soldering

(1) Do not immerse the capacitor body into the solder bath as excessive internal pressure could result.
(2) Apply proper soldering conditions (temperature, time, etc.). Do not exceed the specified limits.
(3) Do not allow other parts or components to touch the capacitor during soldering.
(4) Radial lead type capacitors are not allowed for the reflow soldering.

2.5 Other Soldering Considerations

Rapid temperature rise during the preheat operation and resin bonding operation can cause cracking of the capacitor's vinyl sleeve.
For heat curing, do not exceed 150 ℃ for the maximum time of 2 minutes.

2.6 Capacitor Handling after Soldering

(1) Avoid moving the capacitor after soldering to prevent excessive stress on the lead wires where they enter the seal.
(2) Do not use the capacitor as a handle when moving the circuit board assembly.
(3) Avoid striking the capacitor after assembly to prevent failure due to excessive shock.

2.7 Circuit Board Cleaning

(1) Circuit boards can be immersed or ultrasonically cleaned using suitable cleaning solvents for up to 5 minutes and up to 60 ℃ maximum temperatures. The boards should be thoroughly rinsed and dried.
The use of ozone depleting cleaning agents is not recommended for the purpose of protecting our environment.
(2) Avoid using the following solvent groups unless specifically allowed in the specification ;

- Halogenated cleaning solvents : except for solvent resistant capacitor types, halogenated solvents can permeate the seal and cause internal capacitor corrosion and failure.
  For solvent resistant capacitors, carefully follow the temperature and time requirements based on the specification. 1-1-1 trichloroethane should never be used on any aluminum electrolytic capacitor.
- Alkaline solvents : could react and dissolve the aluminum case.
- Petroleum based solvents : deterioration of the rubber seal could result.
- Xylene : deterioration of the rubber seal could result.
- Acetone : removal of the ink markings on the vinyl sleeve could result.

(3) A thorough drying after cleaning is required to remove residual cleaning solvents that may be trapped between the capacitor and the circuit board. Avoid drying temperatures, which exceed the Upper category temperature of the capacitor.
(4) Monitor the contamination levels of the cleaning solvents during use in terms of electrical conductivity, pH, specific gravity, or water content. Chlorine levels can rise with contamination and adversely affect the performance of the capacitor.
(5) Depending on the cleaning method, the marking on a capacitor may be erased or blurred.

Please consult us if you are not certain about acceptable cleaning solvents or cleaning methods.

2.8 Mounting Adhesives and Coating Agents

When using mounting adhesives or coating agents to control humidity, avoid using materials containing halogenated solvents.
Also, avoid the use of chloroprene based polymers.
Harden on dry adhesive or coating agents well lest the solvent should be left.
After applying adhesives or coatings, dry thoroughly to prevent residual solvents from being trapped between the capacitor and the circuit board.

2.9 Fumigation

In exporting electronic appliances with aluminum electrolytic capacitors, in some cases fumigation treatment using such halogen compound as methyl bromide is conducted for wooden boxes.
If such boxes are not dried well, the halogen left in the box is dispersed while transported and enters in the capacitors inside. This possibly causes electrical corrosion of the capacitors. Therefore, after performing fumigation and drying make sure that no halogen is left.
Don't perform fumigation treatment to the whole electronic appliances packed in a box.

2.9 Flux

If you use a halogen type (Chlorine type, Bromine type, etc.) high-activity flux, please use it after confirmation in advance, as it may have an impact on performance and reliability of this product due to the residue of the flux.

3. Precautions for using capacitors

3.1 Environmental Conditions

Capacitors should not be stored or used in the following environments.

(1) Exposure to temperatures above the upper category or below the lower category temperature of the capacitor.
(2) Direct contact with water, salt water, or oil.
(3) High humidity conditions where water could condense on the capacitor.
(4) Exposure to toxic gases such as hydrogen sulfide, sulfuric acid, nitric acid, chlorine, Chlorine compound, Bromine, Bromine compound or ammonia.
(5) Exposure to ozone, radiation, or ultraviolet rays.
(6) Vibration and shock conditions exceeding specified requirements.
Even within the specified requirements, a large vibration acceleration may be applied due to resonance, so be sure to evaluate and confirm with the actual product.

3.2 Electrical Precautions

(1) Avoid touching the terminals of a capacitor as a possible electric shock could result. The exposed aluminum case is not insulated and could also cause electric shock if touched.
(2) Avoid short circuiting the area between the capacitor terminals with conductive materials including liquids such as acids or alkaline solutions.
(3) A low-molecular-weight-siloxane which is included in a silicon material shall causes abnormal electrical characteristics.

4. Emergency Procedures

(1) If the pressure relief of the capacitor operates, immediately turn off the equipment and disconnect from the power source.
This will minimize an additional damage caused by the vaporizing electrolyte.
(2) Avoid contact with the escaping electrolyte gas, which can exceed 100 ℃ temperatures.
If electrolyte or gas enters the eye, immediately flush the eye with large amounts of water.
If electrolyte or gas is ingested by mouth, gargle with water.
If electrolyte contacts the skin, wash with soap and water.

5. Long Term Storage

Leakage current of a capacitor increases with long storage times. The aluminum oxide film deteriorates as a function of temperature and time.
If used without reconditioning, an abnormally high current will be required to restore the oxide film.
This surge current could cause the circuit or the capacitor to fail.
Expiration date is 42 months from outgoing inspection date.
However, expiration date for series which are not listed below is 12 months from outgoing inspection date.

Type	Series	Expiration date
Radial Lead Type	FC、FK、HD、TA、TP	42 months from outgoing inspection date

For storage condition, keep room temperature (5℃～35℃) and humidity (45%～85%) where direct sunshine doesn't reach.

5.1 Environmental Conditions

Do not store under condition outside the area described in the specification, and also under conditions listed below.

(1) Exposure to temperatures above the upper category or below the lower category temperature of the capacitor.
(2) Direct contact with water, salt water, or oil.
(3) High humidity conditions where water could condense on the capacitor.
(4) Exposure to toxic gases such as hydrogen sulfide, sulfuric acid, nitric acid, chlorine, Chlorine compound, Bromine, Bromine compound or ammonia.
(5) Exposure to ozone, radiation, or ultraviolet rays.
(6) Vibration and shock conditions exceeding specified requirements.

6. Capacitor Disposal

When disposing capacitors, use one of the following methods.

(1) Incinerate after crushing the capacitor or puncturing the can wall (to prevent explosion due to internal pressure rise).
(2) Dispose as solid waste.

NOTE : Local laws may have specific disposal requirements which must be followed.
