Figure 5 Connection example

10 Assembly

Figure 6 Connection of a sensor to an IO-Link master via the converter

- Connect the IO-Link interface of the converter to an IO-Link port of the higher-level IO-Link master using a standardized 3-pos. cable.
- Connect the analog sensor directly to the analog converter input or using a shielded 4-pos. cable.
- Fasten each connection using the M12 connectors.

In environments with high levels of interference, in particular, Phoenix Contact recommends connecting the converter to an appropriate functional earth ground point using an M4 screw.

12 Process data

The device occupies one word of IN process data and one word of OUT process data.

12.1 IN process data

The measured values are depicted in IB IL or S7-compatible format.

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
V	Analog value														

V Sign bit (= 0, not relevant)

By some formats bit 2 ... bit 0 are not relevant for the measured value. They are set to 0.

A diagnostic code is mapped to the input data in the event of an error.

IB IL format

Values $> 8000_{\text{hex}}$ and $< 8100_{\text{hex}}$ indicate an error.

Code (hex)	Cause
8001	Overrange
8002	Wire break
8003	Short-circuit
8004	Measured value invalid/no valid measured value available
8040	Device faulty
8080	Underrange

S7-compatible format

In the S7-compatible format exist two diagnostic codes, see the following table.

Code (hex)	Cause
7FFF	Overrange
8000	Wire break/short-circuit/underrange

12.2 OUT process data

The device can be configured via the process data output word.

The following configurations are possible:

- Selection of the sensor type
- Selection of formats for representing measured values
- Adjusting the resolution

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Configuration	Reserved							Resolution		Format		Sensor type			

For the exact meaning of the individual bits, please refer to “Parameterization (80_{hex}: ParaWord)”.

12.3 Parameterization via OUT process data

Reparameterization can be carried out via the output process data, however this is not saved permanently on the device.

Please operate the reparameterization only by the startup of the device!

The following sequence applies regardless of the format (IB IL or S7-compatible):

- The master sends parameter data (OutputProcessData with bit 15 = 1)

In order to start configuration, bit 15 of the output word must be set to 1. If bit 15 = 0, the default configuration is active.

- The device interrupts the transmission of current process data and responds with the following diagnostic code in the process data:

Code (hex)	Cause
8800	Parameter OK
8801	Parameter ERROR

- If the diagnostic code is OK, the parameter data is accepted immediately. The master can end parameterization (OutputProcessData with bit 15 = 0). The device returns to normal operation with cyclic process data transmission.
- In the event of the ERROR diagnostic code, the master can abort parameterization without modified parameter data (OutputProcessData with bit 15 = 0) or transmit the modified parameterization (return to step 1).

12.4 Example

The example applies to the following changes:

- Adjusting the resolution
from 0.1 °C to 0.1 °F
- Selection of formats
S7-compatible (Default) to IB IL
- Selection of the Sensor type
Pt 100 DIN (Default) to Linear R 0 Ω ... 500 Ω

* The format representation is based on 0.1 $^{\circ}\text{C}/^{\circ}\text{F}$. The actual resolution is 0.5 $^{\circ}\text{C}/^{\circ}\text{F}$.
The measurement is thus always in 0.5 $^{\circ}\text{C}/^{\circ}\text{F}$ increments (steps).

14.2 Parameterization (80_{hex}: ParaWord)

Parameterize the device using this object.

In the case of valid parameters, the parameterization is permanently stored on the device.

After a reset, the device operates with the last permanently stored data. Upon delivery, the device operates with the default data (default settings).

Saving data to the device leads to a communication failure of around 30 ms.
