

# 250mA, Ultra-Low Noise, Low Quiescent Current, LDO Regulator

## General Description

The RT9086 is a high performance positive low dropout (LDO) regulator designed for applications requiring very low dropout voltage and ultra-high Power Supply Ripple Rejection (PSRR) low noise, low quiescent current that can supply up to 250mA output current. The input voltage range is from 2.2V to 5.5V. The device is designed to work with a 1μF input and a 1μF output ceramic capacitor (no separate noise bypass capacitor is required).

The RT9086 features a precise 2% output regulation over line, load, and temperature variations in WL-CSP-4B 0.67x0.67 (BSC) package. The output voltage is available from 1.2V to 4.5V in 25mV steps.

## Ordering Information

Note :

Richtek products are :

- ▶ RoHS compliant and compatible with the current requirements of IPC/JEDEC J-STD-020.
- ▶ Suitable for use in SnPb or Pb-free soldering processes.

## Simplified Application Circuit

## Features

- Input Voltage Range : 2.2V to 5.5V
- Adjustable Output Voltage : 1.2V to 4.5V
- PSRR
  - ▶ 85dB @ 1kHz (20mA)
  - ▶ 80dB @ 10kHz (20mA)
- Output Current : 250mA
- Very Low Dropout : 120mV
- Very Low I<sub>Q</sub> (Enabled) : 16μA
- Virtually Zero I<sub>Q</sub> (Disable) : < 1μA
- Very Low I<sub>G</sub> (Enabled) : 16μA
- Start-up Time : 80μs
- -40°C to 125°C Operating Junction Temperature Range
- Excellent Noise Immunity
- Fast Response Overload and Line Transient
- Stable with a 1μF Input and Output Ceramic Capacitors
- Accurate Output Voltage 2% Overload, Line, Process, and Temperature Variations
- Over-Current Protection
- Over-Temperature Protection

## Applications

- Mobile Phones, Tablets
- Digital Cameras and Audio Devices
- Portable and Battery-Powered Equipment
- Portable Medical Equipment
- Smart Meters
- IP Cameras
- Drones
- Telecom/Networking Cards
- Wireless Infrastructures
- Medical Equipments

## Marking Information

For marking information, contact our sales representative directly or through a Richtek distributor located in your area.

Pin Configuration

(TOP VIEW)

SOT-23-5

ZQFN-4L 1x1

WL-CSP-4B 0.67x0.67 (BSC)

Functional Pin Description

Pin No.			Pin Name	Pin Function
SOT-23-5	ZQFN-4L 1x1	WL-CSP-4B 0.67x0.67		
1	4	A1	VIN	Supply input. A minimum of 1 $\mu$ F ceramic capacitor should be placed as close as possible to this pin for better noise rejection.
2	2	B2	GND	Common ground.
3	3	B1	EN	Enable control input. Connecting this pin to logic high enables the regulator or driving this pin low puts it into shutdown mode. EN can be connected to GND if not used.
4	--	--	NC	No internal connection.
5	1	A2	VOUT	Output of the regulator. Decouple this pin to GND with at least 1 $\mu$ F for stability.
--	5 (Exposed Pad)	--	GND	Thermal pad for ZQFN-4L 1x1 package, connect to GND.

**Functional Block Diagram**

**Operation**

**Basic Operation**

The RT9086 is a high performance positive low dropout (LDO) regulator designed for applications requiring very low dropout voltage, ultra-high Power Supply Ripple Rejection (PSRR), low noise and low quiescent current that can supply up to 250mA output current. The input voltage range is from 2.2V to 5.5V. The RT9086 features a precise 2% output regulation over line, load, and temperature variations. The output voltage is available from 1.2V to 4.5V in 25mV steps. The minimum required output capacitance for stable operation is 1μF (X5R or X7R) effective capacitance after consideration of the temperature and voltage coefficient of the capacitor.

**Enable and Shutdown Operation**

The RT9086 goes into shutdown mode when the EN pin is in a logic low condition. In this condition, the pass transistor, error amplifier, and bandgap are all turned off, reducing the supply current to only 1μA (max.). If the shutdown mode is not required, the EN pin can be directly tied to VIN pin to keep the LDO on.

**Over-Temperature Protection (OTP)**

The over-temperature protection function will turn off the P-MOSFET when the junction temperature exceeds 160°C (typ.), and the output current exceeds 250mA. Once the junction temperature cools down by approximately 26°C (typ.), the regulator will automatically resume operation.

**Current Limit Protection**

The RT9086 provides current limit function to prevent the device from damages during overload or shorted-circuit condition. This current is detected by an internal sensing transistor.

**Error Amplifier**

The Error Amplifier compares the internal reference voltage with the output feedback voltage from the internal divider, and controls the Gate voltage of P-MOSFET to support good line regulation and load regulation at output voltage.

**Output Automatic Discharge**

The RT9086 output employs an internal 10Ω (typ.) pull down resistance to discharge the output when the EN pin is low, and the device is disabled.

**Absolute Maximum Ratings** (Note 1)

- VIN, EN to GND ----- -0.3V to 6V
- VOUT to GND ----- -0.3V to 6V
- Power Dissipation, PD @ TA = 25°C

- Note 1.** Stresses beyond those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions may affect device reliability.
- Note 2.**  $\theta_{JA}$  is measured under natural convection (still air) at  $T_A = 25^\circ\text{C}$  with the component mounted on a high effective-thermal-conductivity four-layer test board on a JEDEC 51-7 thermal measurement standard.  $\theta_{JC}$  is measured at the top of the package.
- Note 3.** Devices are ESD sensitive.
- Note 4.** The device is not guaranteed to function outside its operating conditions.
- Note 5.** Maximum available load  $I_{OUT\_SUPPORT}$  with different  $V_{IN}$  due to thermal consideration refers to the curves at Typical Operating Characteristics.
- Note 6.** Quiescent current is defined here as the difference in current between the input voltage source and the load at  $V_{OUT}$ .
- Note 7.** This specification is guaranteed by design.
- Note 8.** Ground current is defined here as the total current flowing to ground as a result of all input voltages applied to the device.
- Note 9.** Dropout voltage is the voltage difference between the input and the output at which the output voltage drops to 100mV below its nominal value.

## Application Information

Like any low dropout linear regulator, the RT9086's external input and output capacitors must be properly selected for stability and performance. Use a 1μF (X5R or X7R) or larger input capacitor and place it close to the IC's VIN and GND pins. Output capacitor effective capacitance larger than 1μF (X5R or X7R) requirement may be used. Place the output capacitor close to the IC's VOUT and GND pins. Increasing capacitance and decreasing ESR can improve the circuit's PSRR and line transient response.

### Chip Enable Operation

The RT9086 EN pin internal resistor is 1MΩ to GND. The EN pin is the chip enable input. Pull the EN pin low (< 0.4V) will shutdown the device. During shutdown mode, the RT9086 quiescent current drops to lower than 1μA. Drive the EN pin to high (> 1.2V, < 5.5V) will turn on the device again.

### Dropout Voltage

The dropout voltage refers to the voltage difference between the VIN and VOUT pins while operating at specific output current. The dropout voltage  $V_{DROP}$  also can be expressed as the voltage drop on the pass-FET at specific output current ( $I_{RATED}$ ) while the pass-FET is fully operating at ohmic region and the pass-FET can be characterized as an resistance  $R_{DS(ON)}$ . Thus the dropout voltage can be defined as ( $V_{DROP} = V_{VIN} - V_{VOUT} = R_{DS(ON)} \times I_{RATED}$ ). For normal operation, the suggested LDO operating range is ( $V_{VIN} > V_{VOUT} + V_{DROP}$ ) for good transient response and PSRR ability. Vice versa, while operating at the ohmic region will degrade these performance severely. Output discharge automatically the RT9086 output employs an internal 10Ω pull-down resistance to discharge the output when EN pin is low, and the device is disabled.

### C<sub>IN</sub> and C<sub>OUT</sub> Selection

Like any low dropout regulator, the external capacitors of the RT9086 must be carefully selected for regulator stability and performance. Using a capacitor of at least 1μF (X5R or X7R) is suitable. With a reasonable PCB layout, the ceramic output capacitor can be placed up

to 5cm and the ceramic input capacitor can be placed up to 1cm of the chip. Any good quality ceramic capacitor can be used. However, a capacitor with larger value and lower ESR (Equivalent Series Resistance) is recommended since it will provide better PSRR and line transient response.

The RT9086 is designed specifically to work with low ESR ceramic output capacitor for space saving and performance consideration. Using a ceramic capacitor with capacitance of at least 1μF (X5R or X7R) on the RT9086 output ensures stability.

### Minimum Operating Input Voltage (V<sub>IN</sub>)

The RT9086 does not include any dedicated UVLO circuitry. The RT9086 internal circuitry is not fully functional until VIN is at least 2.2V. The output voltage is not regulated until VIN has reached at least the greater of 2.2 V or ( $V_{OUT} + V_{DROP}$ ).

### Thermal Considerations

The junction temperature should never exceed the absolute maximum junction temperature  $T_{J(MAX)}$ , listed under Absolute Maximum Ratings, to avoid permanent damage to the device. The maximum allowable power dissipation depends on the thermal resistance of the IC package, the PCB layout, the rate of surrounding airflow, and the difference between the junction and ambient temperatures. The maximum power dissipation can be calculated using the following formula :

$$P_{D(MAX)} = (T_{J(MAX)} - T_A) / \theta_{JA}$$

where  $T_{J(MAX)}$  is the maximum junction temperature,  $T_A$  is the ambient temperature, and  $\theta_{JA}$  is the junction-to-ambient thermal resistance.

For continuous operation, the maximum operating junction temperature indicated under Recommended Operating Conditions is 125°C. The junction-to-ambient thermal resistance,  $\theta_{JA}$ , is highly package dependent. For a SOT-23-5 package, the thermal resistance,  $\theta_{JA}$ , is 218.1°C/W on a standard JEDEC 51-7 high effective-thermal-conductivity four-layer test board. For a ZQFN-4L 1x1 package, the thermal resistance,  $\theta_{JA}$ , is 92.7°C/W on a standard JEDEC 51-7 high effective-thermal-conductivity

four-layer test board. For a WL-CSP-4B 0.67x0.67 (BSC) package, the thermal resistance,  $\theta_{JA}$ , is 214.9°C/W on a standard JEDEC 51-7 high effective-thermal-conductivity four-layer test board. The maximum power dissipation at  $T_A = 25^\circ\text{C}$  can be calculated as below :

$$P_{D(MAX)} = (125^\circ\text{C} - 25^\circ\text{C}) / (218.1^\circ\text{C/W}) = 0.45\text{W for a SOT-23-5 package.}$$

$$P_{D(MAX)} = (125^\circ\text{C} - 25^\circ\text{C}) / (92.7^\circ\text{C/W}) = 1.07\text{W for a ZQFN-4L 1x1 package.}$$

$$P_{D(MAX)} = (125^\circ\text{C} - 25^\circ\text{C}) / (214.9^\circ\text{C/W}) = 0.46\text{W for a WL-CSP-4B 0.67x0.67 (BSC) package.}$$

The maximum power dissipation depends on the operating ambient temperature for the fixed  $T_{J(MAX)}$  and the thermal resistance,  $\theta_{JA}$ . The derating curves in Figure 1 allows the designer to see the effect of rising ambient temperature on the maximum power dissipation.

Figure 1. Derating Curve of Maximum Power Dissipation

**Layout Considerations**

The dynamic performance of the RT9086 is dependent on the layout of the PCB. PCB layout practices that are adequate for typical LDOs may degrade the PSRR, noise, or transient performance of the RT9086.

Best performance is achieved by placing  $C_{IN}$  and  $C_{OUT}$  on the same side of the PCB as the RT9086, and as close to the package as is practical. The ground connections for  $C_{IN}$  and  $C_{OUT}$  must be back to the RT9086 ground pin using as wide and short a copper

trace as is practical.

Connections using long trace lengths, narrow trace widths, and/or connections through vias must be avoided. These add parasitic inductances and resistance that results in inferior performance especially during transient conditions.

4B WL-CSP 0.67x0.67 Package (BSC)

**Footprint Information**

Package	Number of Pin	Footprint Dimension (mm)							Tolerance
		P1	P2	A	B	C	D	M	
TSOT-25/TSOT-25(FC)/SOT-25	5	0.95	1.90	3.60	1.60	1.00	0.70	2.60	±0.10

Package	Number of Pin	Footprint Dimension (mm)											Tolerance
		P	Ax	Ay	Bx	By	C	C1	D	D1	Sx	Sy	
U/X/ZQFN1x1-4	4	0.625	1.800	0.900	0.450	0.350	0.675	0.474	0.275	0.074	0.400	0.400	±0.050

Package	Number of Pin	Type	Footprint Dimension (mm)			Tolerance
			e	A	B	
WL-CSP0.67x0.67-4(BSC)	4	NSMD	0.350	0.200	0.300	±0.025
		SMD		0.230	0.200
