

Isolated Current Sensor with Common Mode Field Rejection

Description

The SenkoMicro SC810 provides economical and precise solutions for AC or DC current sensing in industrial, commercial, and communications systems. The device package allows for easy implementation by the customer.

The device consists of a precise, low-offset, linear Hall circuit with a copper conduction path located near the surface of the die. Applied current flowing through this copper conduction path generates a magnetic field which the Hall IC converts into a proportional voltage. A precise, proportional voltage is provided by the low-offset, chopper-stabilized Linear Hall IC, which is programmed for accuracy after packaging.

The terminals of the conductive path (from pin1 and 2 to pin 3 and 4) are electrically isolated from the signal leads (pins 5 through 8). This allows the SC810 to be used in applications requiring electrical isolation without the use of opto-isolators or other costly isolation techniques.

Package: 8-Lead SOP-SC

Features

- Differential hall sensing rejects common mode fields
- Output voltage proportional to AC or DC currents
- Selected Reference voltage mode: $V_{CC}/2$, $0.1 V_{CC}$
- Total output error 0.5% @ $T_A = 25^\circ\text{C}$, 3% for full temperature range.
- 4 μs output rise time in response to step input current
- 1.2m Ω internal conductor resistance
- > 2 kV RMS minimum isolation voltage from pins 1-4 to pins 5-8
- Nearly zero magnetic hysteresis
- Small footprint, low-profile SOP8-SC package

Application Field

- Smart power meter
- Brushless DC motor commutation
- Load detection and management
- Switch mode power supplies

Typical Application

- Support 0 ~ $\pm 30\text{A}$, AC or DC

Note:

1. 4.7uF bypass is **MUST** have to guarantee performance;
2. 0.1uF bypass capacitor is optional for VCC;
3. The Zener or TVS diode is optional for protection purpose.

Absolute Maximum Ratings

Absolute maximum ratings are limiting values to be applied individually, and beyond which the serviceability of the circuit may be impaired. Functional operability is not necessarily implied. Exposure to absolute maximum rating conditions for an extended period of time may affect device reliability.
