SGM804
Low-Power µP Reset Circuit with Capacitor-Adjustable Reset Timeout Delay

GENERAL DESCRIPTION

The SGM804 can monitor system voltages from 1.6V to 5V. When V_{CC} voltage drops below the reset threshold, the device will send a reset signal. When V_{CC} voltage rises to the reset threshold, the reset output remains low within a user-adjustable reset timeout period set by an external capacitor. The SGM804 also features an excellent transient immunity to ignore fast V_{CC} transients.

The SGM804 is available in a Green SOT-23-5 package. It operates over an ambient temperature range of -40℃ to +85℃.

OVERSTRESS CAUTION

Stresses beyond those listed in Absolute Maximum Ratings may cause permanent damage to the device. Exposure to absolute maximum rating conditions for extended periods may affect reliability. Functional operation of the device at any conditions beyond those indicated in the Recommended Operating Conditions section is not implied.

ESD SENSITIVITY CAUTION

This integrated circuit can be damaged if ESD protections are not considered carefully. SGMICRO recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage. ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because even small parametric changes could cause the device not to meet the published specifications.

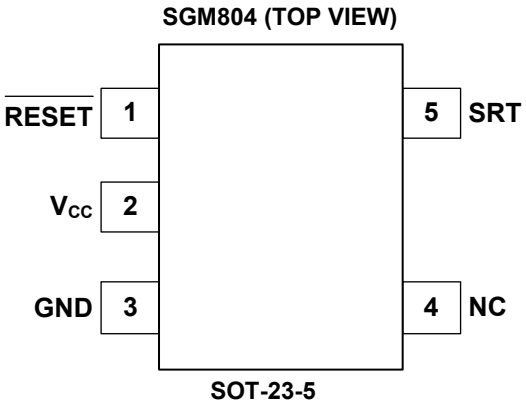
PIN CONFIGURATION



PIN DESCRIPTION

PIN	NAME	FUNCTION
1	$\overline{\text{RESET}}$	Active-Low Reset Output. If V_{CC} is lower than the reset threshold, the $\overline{\text{RESET}}$ goes low. If V_{CC} voltage is higher than the reset threshold, the reset output remains low within the timeout period (t_{RP}).
2	V_{CC}	Supply Voltage Pin.
3	GND	Ground Pin.
4	NC	Not Connected.
5	SRT	Set Reset Timeout Input Pin. Set a capacitor between SRT and GND to adjust t_{RP}. It is determined by: t_{RP} (µs) = 2.6 × 10^6 × C_{SRT} (µF) + 340µs
