

GENERAL DESCRIPTION

The SGM431x is a precision programmable shunt voltage reference that can be used in many applications. It is a three-terminal adjustable-output device that can keep stable under all capacitive loads. It requires two external capacitors in application to set the output voltage is to any value between V_{REF} and 36V. All versions have a maximum operating current of 100mA.

The SGM431x features low dynamic impedance, low noise, and low temperature coefficient to ensure a stable output voltage over a wide range of operating temperatures and currents. The high performances make it very suitable for multiple applications, such as precision audio components and flyback switching power supplies.

The SGM431 is available in Green SOIC-8, SOT-23, SOT-89-3, SOT-23-5 and SC70-6 packages. The SGM431B is available in Green SOIC-8, SOT-23, SOT-89-3 and SOT-23-5 packages.

OVERSTRESS CAUTION

Stresses beyond those listed in Absolute Maximum Ratings may cause permanent damage to the device. Exposure to absolute maximum rating conditions for extended periods may affect reliability. Functional operation of the device at any conditions beyond those indicated in the Recommended Operating Conditions section is not implied.

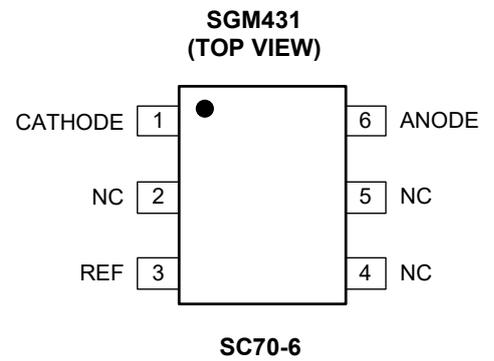

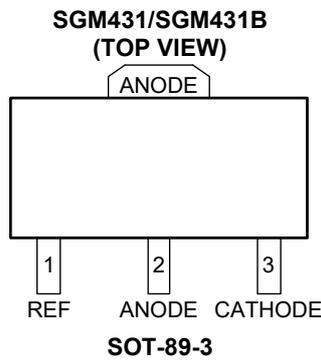

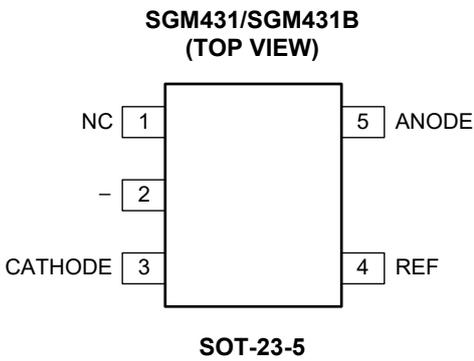

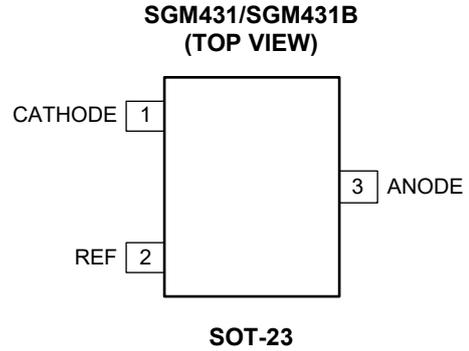

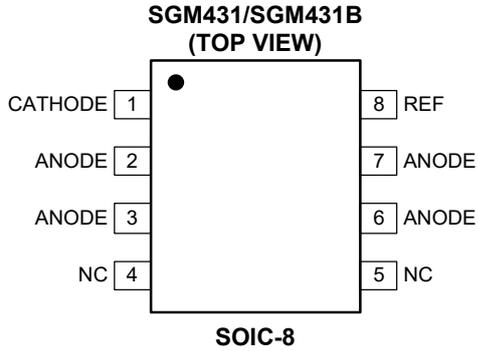

ESD SENSITIVITY CAUTION

This integrated circuit can be damaged if ESD protections are not considered carefully. SGMICRO recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage. ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because even small parametric changes could cause the device not to meet the published specifications.

NOTES:

1. V_{I(DEV)} and I_{I(DEV)} refer to the difference between the maximum value minus the minimum value obtained within the rated temperature range. α_{VREF} is defined as:

$$|\alpha_{VREF}| \left(\frac{\text{ppm}}{^{\circ}\text{C}} \right) = \left| \frac{\left(\frac{V_{I(DEV)}}{V_{REF \text{ at } 25^{\circ}\text{C}}} \right) \times 10^6}{\Delta T_J} \right|$$

where,

ΔT_J is the rated operating junction temperature range of the device.

α_{VREF} is the average full-range temperature coefficient of the reference input voltage.

2. |Z_{KA}| = ΔV_{KA} / ΔI_{KA}, when the device is operating with two external resistors, the total dynamic impedance of the circuit is equal to:

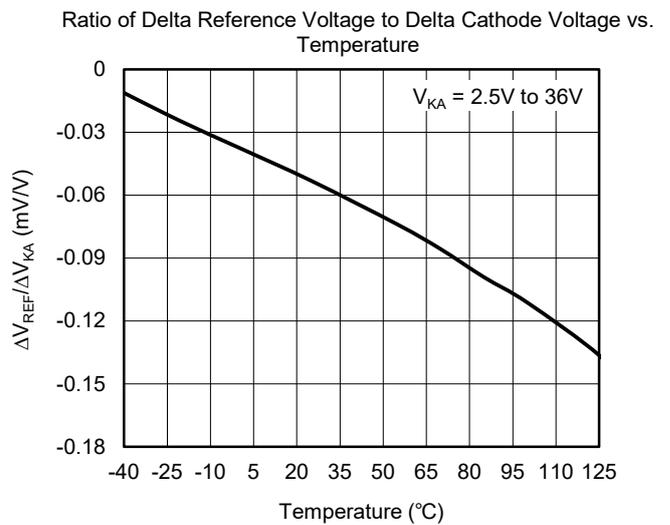

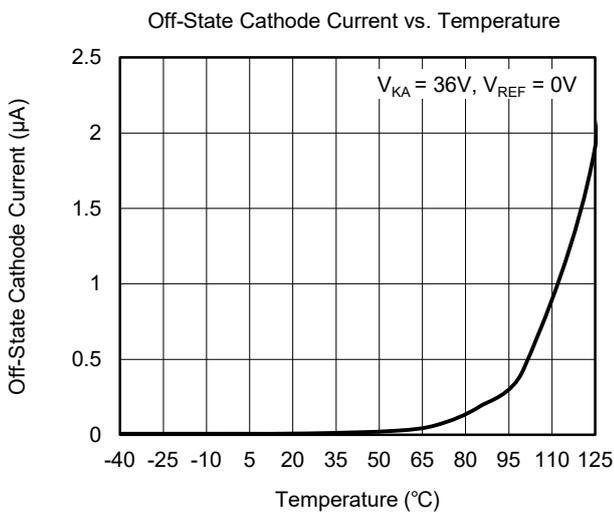

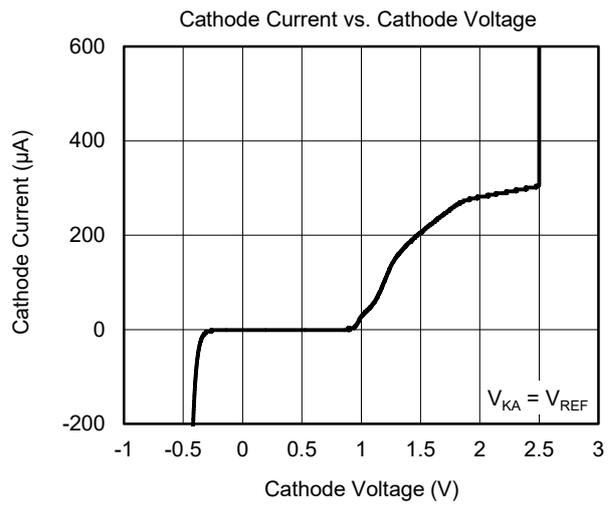

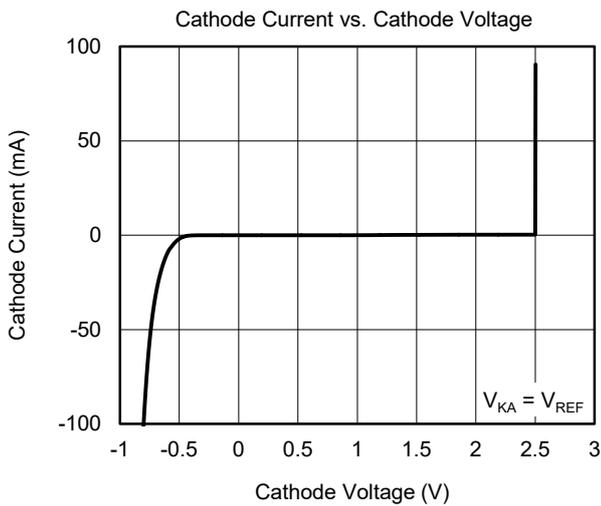

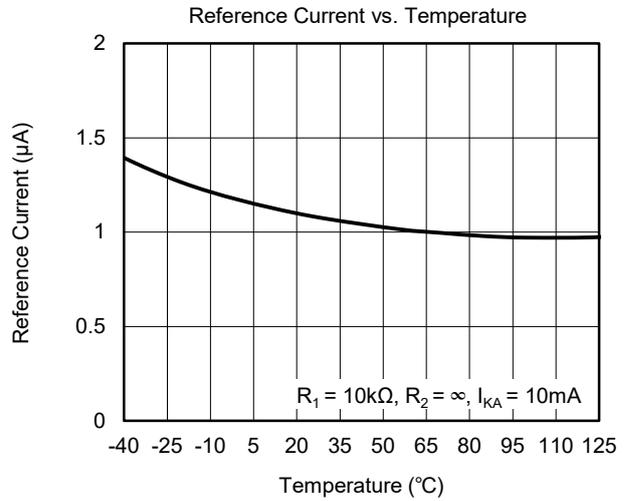

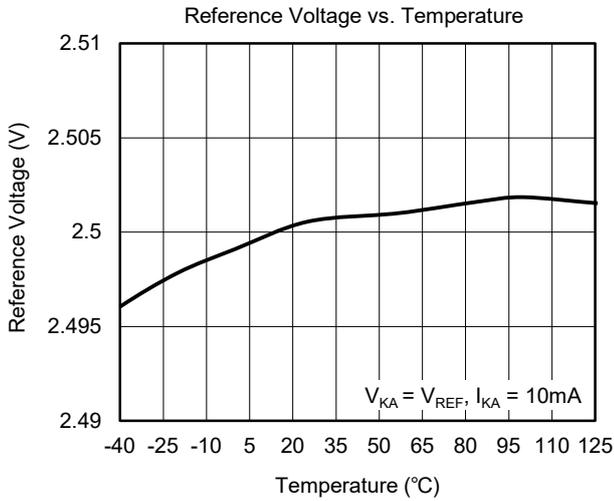

$$|Z'| = \frac{\Delta V}{\Delta I}$$

which is approximately equal to

$$|Z_{KA}| \left(1 + \frac{R_1}{R_2} \right)$$
