SGM5347-10
8 Channels, 10-Bit Digital-to-Analog Converter with Output Operational Amplifier

GENERAL DESCRIPTION

The SGM5347-10 features 8 channels of 10-bit digital-to-analog converter (DAC) with output amplifiers. The output amplifier provides high current drive capability. The digital data is input via a serial link bus. Only three control lines are required, and cascaded connections can be used. The SGM5347-10 provides daisy-chain capability, which can update multiple SGM5347-10s simultaneously by using a single serial interface.

The SGM5347-10 is available in Green SOIC-16 and TSSOP-16 packages. It operates over an ambient temperature range of -40℃ to +125℃.

FEATURES

- **Low Power Consumption (0.5mW/CH)**
- **Integrating 8 Channels of 10-Bit DAC**
- **Build-In Analog Output Amplifier:**
  Sink/Source Current with Short Current Control
- **Daisy-Chain Operation**
- **8 Channels Outputs Update Simultaneously**
- **Independent Channel Power-Down Function**
  - **0.6μA (TYP) I_{CC} for Power-Down Mode**
- **The Range of D/A Conversion can be Independently Set by Separating the Power Supply for MCU Interface and Operational Amplifier and the Power Supply for DAC**
- **Capable of Being Controlled Directly by a 3V MCU**
- **Power-On Reset: Output Reset to GND**
- **Serial Data Input: Up to 2.5MHz Operation**
- **Power Supply Voltage Range: 2.8V to 5.5V**
- **Available in Green SOIC-16 and TSSOP-16 Packages**

OVERSTRESS CAUTION

Stresses beyond those listed in Absolute Maximum Ratings may cause permanent damage to the device. Exposure to absolute maximum rating conditions for extended periods may affect reliability. Functional operation of the device at any conditions beyond those indicated in the Recommended Operating Conditions section is not implied.

ESD SENSITIVITY CAUTION

This integrated circuit can be damaged if ESD protections are not considered carefully. SGMICRO recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage. ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because even small parametric changes could cause the device not to meet the published specifications.

DISCLAIMER

PIN DESCRIPTION

PIN	NAME	TYPE	FUNCTION
1	V_{REF-}	-	Negative Reference Voltage Input Pin. Always connect this pin to ground in application.
8	V_{REF+}	-	Positive Reference Voltage Input Pin.
9	V_{CC}	-	Power Supply Pin. Power supply pin of MCU interface and operational amplifier.
16	GND	-	Ground Pin. Ground pin of MCU interface and operational amplifier.
15, 2, 3, 4, 5, 6, 7, 10	AO1-AO8	O	DAC Output Pins. These pins are 10-bit DAC outputs with operational amplifiers.
11	DOUT	O	Data Output Pin. This pin outputs MSB of the 14-bit shift register.
12	LD	I	Load Signal Input Pin. If LD pin is brought from low to high, the data of shift register is loaded to the decoder and the register for DAC output.
13	CLK	I	Shift Clock Input Pin. The input signal from the DIN pin is input to a 14-bit shift register on the rising edge of the shift clock.
14	DIN	I	Serial Data Input Pin. This pin inputs 14-bit length serial data.

NOTE: DIN, CLK, and LD pins should remain "L" level at non-data transfer.

NOTES:

1. Nonlinearity error: The error of the I/O curve deviated from the ideal straight line between output voltages at "#00C" and "#3F3".
2. Differential nonlinearity error: The error deviated from the ideal increment given when the digital value is incremented by one bit.
3. At +125℃, please limit the output current of each channel to 5mA for maximum operating life time.

Data for Shift Register

- SGM5347-10 has a 14-bit shift register for chip control.
- It is necessary to set the data as following configuration to a 14-bit shift register.
- The data consists of 14 bits: a 4-bit address selection and a 10-bit DAC control signal.

PWR_DWN register is not readable. Setting the bit to 1 powers down the corresponding DAC channel. Clearing the bit brings it up. If all the channels are powered down then the bias circuit will be powered down as well.

Table 1. CONTROL Register Details

BITS	BIT NAME	DESCRIPTION
DB[9:6]	N/A	
DB[5]	RST	1 = Reset internal circuit other than the shift register. Will be automatically cleared to 0 after writing a 1. Since the reset doesn't hold, the next frame can be used for command. For example, at the first frame, the RST bit is written so that all DAC outputs reset to 0 at rising edge of the LD signal. The second frame can be a data writing command, but the DAC outputs won't be changed from 0 until writing of the data takes effect by the LD signal of the second frame.
DB[4]	UPDATE	1 = The rising edge of LD signal updates data in DIN register of all 8 channels to the corresponding data registers. The bit is then automatically cleared to 0
DB[3]	SYNC	0 = The rising edge of LD signal loads the data in shift register to DIN and DATA 1 = The rising edge of LD signal only loads the data in shift register to DIN register indicated by ADDR but does not update the data register. LD will update all 8 channels when writing to channel 8.
DB[2]	3K_PULL	0 = The pull-down resistance is around 300kΩ 1 = Enable the 3kΩ pull-down resistors for all the 8 channels. The pull-down resistors are only enabled in power-down mode
DB[1:0]	N/A	Don't care

Example one of a simultaneous update:

1. Write 0x008 to CONTROL register.
2. Write data to channel 1, to channel 2 … to channel 7.
3. Writing data to channel 8 causes all the 8 channels to update at the same time. Then the following writings are still simultaneously updated.
4. Write 0x000 to CONTROL register to exit simultaneous update mode.

Example two of a simultaneous update:

1. Write 0x008 to CONTROL register.
2. Write data to channel 1, to channel 2 … to channel 7.
3. Write 0x018 to CONTROL register to update all the 8 channels. Then the following writings are still simultaneously updated.
4. Write 0x000 to CONTROL register to exit simultaneous update mode.
