

# SGM58600/SGM58601/SGM58602

## Ultra-Low Noise, 24-Bit Analog-to-Digital Converters

### GENERAL DESCRIPTION

The SGM58600, SGM58601 and SGM58602 are low noise, 24-bit, 60kSPS, delta-sigma ( $\Delta\Sigma$ ) analog-to-digital converters (ADCs).

The SGM58600, SGM58601 and SGM58602 have a fourth-order delta-sigma modulator plus a fifth-order Sinc filter (Sinc<sup>5</sup>) optimized for low noise performance.

The flexible inputs multiplexer supports single-ended input or differential input configuration.

The SGM58600, SGM58601 and SGM58602 feature a selectable input buffer that increases the input impedance, and the low noise programmable gain amplifier (PGA) provides gains from 1 to 128 in binary steps.

The devices have an SPI-compatible interface.

The SGM58600 is available in Green SSOP-20 and TQFN-3.5×3.5-20L packages, the SGM58601 is available in Green SSOP-28 and TQFN-5×5-28L packages, and the SGM58602 is available in a Green TQFN-5×5-20L package. They are all specified from -40°C to +125°C.

### FEATURES

- **Supply Voltage Ranges:**
  - ♦ Analog Supply: 5V
  - ♦ Digital Supply: 2.7V to 5V
- **Noise-Free Resolution: Up to 22 Bits**
- **Data Output Rate: Up to 60kSPS**
- **Integral Nonlinearity (INL):**
  - 0.0012%FSR (TYP) at PGA = 1
- **24-Bit No Missing Codes**
- **Fast Channel Cycling**
  - ♦ 18.3 Bits Noise-Free (21.2 Effective Bits) at 1.4kHz
- **Flexible Input Multiplexer**
  - ♦ 2 Single-Ended Inputs or 1 Differential Inputs (SGM58600)
  - ♦ 8 Single-Ended Inputs or 4 Differential Inputs (SGM58601)
  - ♦ 3 Single-Ended Inputs or 2 Differential Inputs (SGM58602)
- **Low Noise Programmable Gain Amplifier:**
  - 30nV Input-Referred Noise
- **One-Shot Conversions with Single-Cycle Settling**
- **Chopper-Stabilized Input Buffer**
- **Supports Self and System Calibration for All PGA Settings**
- **Supports SPI-Compatible Serial Interface**

### APPLICATIONS

Lab Instrumentation  
Measurement and Test  
Industrial Process Control  
Medical Instruments

**PACKAGE/ORDERING INFORMATION**

MODEL	PACKAGE DESCRIPTION	SPECIFIED TEMPERATURE RANGE	ORDERING NUMBER	PACKAGE MARKING	PACKING OPTION
SGM58600	SSOP-20	-40°C to +125°C	SGM58600XSS20G/TR	SGM58600 XSS20 XXXXX	Tape and Reel, 2000
	TQFN-3.5x3.5-20L	-40°C to +125°C	SGM58600XTRL20G/TR	SGMOV1 XTRL20 XXXXX	Tape and Reel, 5000
SGM58601	SSOP-28	-40°C to +125°C	SGM58601XSS28G/TR	SGM58601 XSS28 XXXXX	Tape and Reel, 2000
	TQFN-5x5-28L	-40°C to +125°C	SGM58601XTQK28G/TR	SGM58601 XTQK28 XXXXX	Tape and Reel, 5000
SGM58602	TQFN-5x5-20L	-40°C to +125°C	SGM58602XTRM20G/TR	SGM58602 XTRM20 XXXXX	Tape and Reel, 5000

**MARKING INFORMATION**

NOTE: XXXXX = Date Code, Trace Code and Vendor Code.

**XXXXX**

Green (RoHS & HSF): SG Micro Corp defines "Green" to mean Pb-Free (RoHS compatible) and free of halogen substances. If you have additional comments or questions, please contact your SGMICRO representative directly.

**ABSOLUTE MAXIMUM RATINGS**

AVDD to AGND .....	-0.3V to 6V
DVDD to DGND .....	-0.3V to AVDD
AGND to DGND .....	-0.3V to 0.3V
Input Current (Continuous) .....	10mA
Analog Inputs to AGND.....	-0.3V to AVDD + 0.3V

ESD Susceptibility	
HBM.....	4000V
CDM .....	1000V

**RECOMMENDED OPERATING CONDITIONS**

Operating Temperature Range .....	-40°C to +125°C
-----------------------------------	-----------------

**OVERSTRESS CAUTION**

Stresses beyond those listed in Absolute Maximum Ratings may cause permanent damage to the device. Exposure to absolute maximum rating conditions for extended periods may affect reliability. Functional operation of the device at any conditions beyond those indicated in the Recommended Operating Conditions section is not implied.

**ESD SENSITIVITY CAUTION**

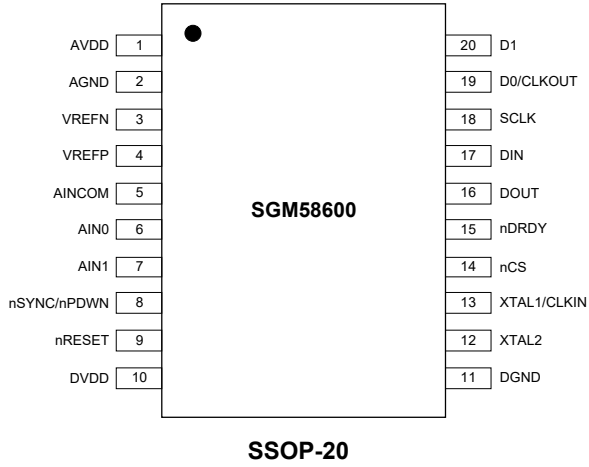

This integrated circuit can be damaged if ESD protections are not considered carefully. SGMICRO recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage. ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because even small parametric changes could cause the device not to meet the published specifications.

**DISCLAIMER**

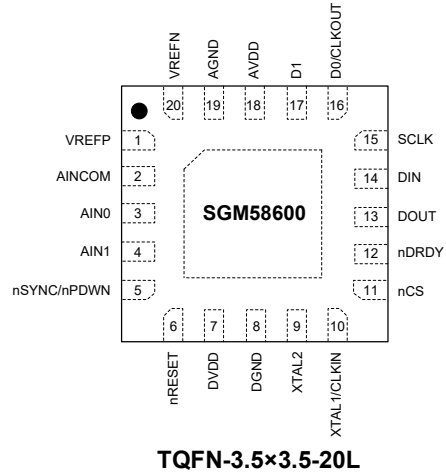

SG Micro Corp reserves the right to make any change in circuit design, or specifications without prior notice.

		$PGA[2:0] = 64$		$\pm 1.5$		
Common-Mode Rejection Ratio	CMRR	$f_{CM}^{(3)} = 60Hz$ , $f_{DATA} = 30kSPS^{(4)}$	92	110		dB
Noise			See Noise Performance Tables			
AVDD Power Supply Rejection		$\pm 5\% \Delta$ in AVDD	65	80		dB
DVDD Power Supply Rejection		$\pm 10\% \Delta$ in DVDD		100		dB

### NOTES:

1. SPS = Samples Per Second.
2. FSR = Full-Scale Range =  $4V_{REF}/PGA$ .
3.  $f_{CM}$  = Common-Mode Input Signal Frequency.
4. Setting a digital filter notch at 60Hz ( $f_{DATA} = 60SPS, 30SPS, 15SPS, 10SPS, 5SPS, \text{ or } 2.5SPS$ ), this can improve the common-mode rejection of this frequency.

nRESET, nSYNC/nPDWN, Pulse Width	$t_{12}$	See Figure 2	0.5		$\mu$ s
Conversion Data Invalid while Being Updated (nDRDY Shown with No Data Retrieval)	$t_{13}$	See Figure 3	30		$\tau_{CLKIN}$ <sup>(4)</sup>

NOTES:

- nCS can be tied low.
- DOUT load = 20pF and 100k $\Omega$  to DGND.
- DOUT goes high-impedance immediately when nCS goes high.
- Master clock period ( $\tau_{CLKIN} = 1/f_{CLKIN}$ ).

**DETAILED DESCRIPTION**

**Overview**

The SGM58600, SGM58601 and SGM58602 are ultra-low noise analog-to-digital converters (ADCs). The block diagram of the SGM5860x ADCs is shown in Figure 4.

The SGM58600 supports 1 differential input or 2 single-ended inputs and has 2 general-purpose digital I/Os. The SGM58601 supports 4 differential inputs or 8 single-ended inputs and has 4 general-purpose digital I/Os. The SGM58602 supports 2 differential inputs or 3 single-ended inputs and has 2 general-purpose digital I/Os.

These chips provide a configurable data rate from 2.5SPS to 60kSPS, the selection is a tradeoff between accuracy and speed.

**Noise Performance**

The typical noise performance with the inputs shorted externally is summarized from Table 1 to Table 6. For the six tables, the following conditions apply:  $T_A = +25^\circ\text{C}$ ,  $V_{AVDD} = 5\text{V}$ ,  $V_{DVDD} = 3.3\text{V}$ ,  $V_{REF} = 2.5\text{V}$ , and  $f_{CLKIN} = 7.68\text{MHz}$ . ENOB is given by:

$$\text{ENOB} = \frac{\ln(\text{FSR} / \text{RMS Noise})}{\ln(2)} \quad (1)$$

Where:

FSR = Full-scale range.

The noise-free bits of resolution are shown in Table 3. Table 1 to Table 3 show that the chip performance when the input buffer is enabled. Table 4 to Table 6 show that the chip performance when the input buffer is disabled.

**Input Multiplexer**

The SGM58601 provides 9 analog inputs, which can be configured as 4 independent differential inputs, 8 single-ended inputs, or a combination of differential and single-ended inputs. The SGM58600 provides 3 analog inputs, which can be configured as 1 differential input or 2

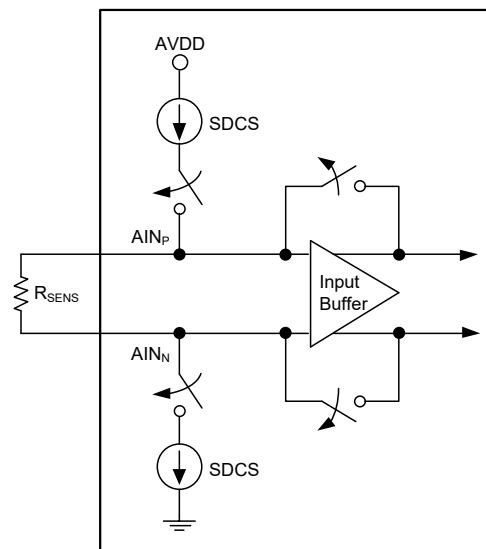

single-ended inputs. The SGM58602 provides 4 analog inputs, which can be configured as 2 independent differential inputs, 3 single-ended inputs. When using the SGM58600 or SGM58602 programming the inputs, make sure to select only the available inputs when programming the input multiplexer control register (MUX).

To minimize the power consumption of the chip, it's better to keep any unused inputs floating.

**Open/Short Sensor Detection**

Figure 5 shows a demo connection of external sensor equal circuits, in which  $R_{\text{SENS}}$  is the sensor equal output impedance.

Please note that when the SDCS (Sensor Detection Current Source) is enabled, the input buffer is forced on regardless of BUFEN bit setting.

**Figure 5. Sensor Detection Circuitry**

**DETAILED DESCRIPTION (continued)**

**Programmable Gain Amplifier (PGA)**

The PGA[2:0] is controlled by the ADCON register. We suggest recalibrating the analog-to-digital converter after changing the PGA setting.

**Table 7. Full-Scale Input Voltage (V<sub>IN</sub>) vs. PGA Setting**

PGA Setting	Full-Scale Input Voltage <sup>(1)</sup> (V <sub>REF</sub> = 2.5V)
1	±5V
2	±2.5V
4	±1.25V
8	±0.625V
16	±312.5mV
32	±156.25mV
64	±78.125mV
128	±39.0625mV

NOTE:

1. Positive inputs minus negative inputs is the voltage range and at the same time to make sure that both positive inputs and negative inputs are absolutely positive respect to ground (listed in the Electrical Characteristics section).

**Modulator Input Circuitry**

The SGM5860x modulator measures the input signal by using internal capacitors that are continuously sampled and reverse sampled between the differential inputs.

When the chip is converting, it draws current from input. The equal input impedance  $Z_{eff} = V_{IN}/I_{AVERAGE}$ . Figure 6 shows the input equal circuitry by their effective impedances.

**Figure 6. Analog Input Effective Impedances with Buffer On/Off**

The effective impedances with buffer off for  $f_{CLKIN} = 7.68\text{MHz}$  is shown in Table 8.

**Table 8. Effective Impedances with Buffer Off**

PGA Setting	Z <sub>eff</sub> (kΩ)
1	67
2	35
4	35
8	255
16	190
32	190
64	190
128	190

NOTE:

1.  $f_{CLKIN} = 7.68\text{MHz}$ .

**Analog Input Buffer**

To increase the input impedance of SGM5860x, the input buffer can be enabled by the BUFEN bit in the STATUS register. The input impedance equal circuits are shown in Figure 6. Table 9 lists the values of Z<sub>eff</sub> for the different PGA settings. The equal input impedance changes inversely with the CLKIN frequency ( $f_{CLKIN}$ ). For example, when the  $f_{CLKIN}$  is reduced by half to 3.84MHz, Z<sub>eff</sub> for PGA = 1 will double from 3.2MΩ to 6.4MΩ.

**Table 9. Effective Impedances with Buffer On**

PGA Setting	Z <sub>eff</sub> (MΩ)
1	3.2
2	1.7
4	1
8	21
16	10
32	5
64	2.4
128	1

NOTE:

1.  $f_{CLKIN} = 7.68\text{MHz}$ .

**Voltage Reference Inputs (VREFP, VREFN)**

The voltage reference of the SGM5860x ADC is the differential voltage between VREFP and VREFN:  $V_{REF} = V_{REFP} - V_{REFN}$ .

**DETAILED DESCRIPTION (continued)**

**Digital Filter**

Inside the chip, there is a Sinc<sup>5</sup> filter and an average filter after the modulator. Its equal architecture is shown in Figure 7.

Table 10 shows the data rate setting and real data rate under f<sub>CLKIN</sub> = 7.68MHz. Note that if the f<sub>CLKIN</sub> increases, the read data rate increases accordingly. For example, the f<sub>CLKIN</sub> from 7.68MHz to 10MHz increases the data rate for DR[7:0] = 11110001 from 60000SPS to 78125SPS.

**Table 10. Number of Averages and Data Rate Setting**

DRATE DR[7:0]	Number of Averages for Programmable Filter (Num_Ave)	Data Rate <sup>(1)</sup> (SPS)
11110001	1	60000
11110000	1	30000
11100000	2	15000
11010000	4	7500
11000000	8	3750
10110000	15	2000
10100001	30	1000
10010010	60	500
10000010	300	100
01110010	500	60
01100011	600	50
01010011	1000	30
01000011	1200	25
00110011	2000	15
00100011	3000	10
00010011	6000	5
00000011	12,000	2.5

NOTE:

1. f<sub>CLKIN</sub> = 7.68MHz.

**Frequency Response**

The chip low-pass digital filter can be calculated based on the following equation:

$$|H(f)| = |H_{\text{Sinc}^5}(f)| \times |H_{\text{Averager}}(f)| \tag{2}$$

$$= \left| \frac{\sin\left(\frac{256\pi \times f}{f_{\text{CLKIN}}}\right)}{64 \times \sin\left(\frac{4\pi \times f}{f_{\text{CLKIN}}}\right)} \right|^5 \times \left| \frac{\sin\left(\frac{256\pi \times \text{Num\_Ave} \times f}{f_{\text{CLKIN}}}\right)}{\text{Num\_Ave} \times \sin\left(\frac{256\pi \times f}{f_{\text{CLKIN}}}\right)} \right|$$

To eliminate 50Hz (or 60Hz) noise from power supply, set the data rate equal to 2.5SPS, 5SPS, 10SPS, 15SPS, 30SPS, or 50SPS (or 60Hz).

**Table 11. First-Notch Frequency and -3dB Bandwidth Filter**

Data Rate <sup>(1)</sup> (SPS)	First-Notch (Hz)	-3dB Bandwidth (Hz)
60000	60000	12000

30	33.5
25	40.2
15	67.0
10	100.2
5	200.2
2.5	400.2

NOTES:

- f<sub>CLKIN</sub> = 7.68MHz.
- In one-shot mode, a small additional delay is needed to start the device from standby.

**Settling Time Using the Input Multiplexer**

The fastest way to switch the input multiplexer is to issue a WREG command immediately when nDRDY goes low, then the next channel conversion starts and we can read conversion data of previous channel at the same time. Figure 12 shows a timing demo of channel switching and data read. Note that when cycling through channel, nDRDY goes low to

indicate data is ready, and there is no data setting time (all processing data are discarded internally).

- When nDRDY goes low, indicating that data is ready to read.
- It will take 14 × τ<sub>CLKIN</sub> for nDRDY to go from low to high, after WREG command is received by ADC.

Table 13 shows the throughput speed when cycling the input multiplexer.

**Table 13. Multiplexer Cycling Throughput**

Data Rate <sup>(1)</sup> (SPS)	Cycling Throughput (1/t <sub>15</sub> ) (Hz)

2.5	2.5

NOTE:

- f<sub>CLKIN</sub> = 7.68MHz.

**Figure 12. Cycling the SGM5860x Input Multiplexer**

**DETAILED DESCRIPTION (continued)**

**Settling Time Using One-Shot Mode**

Issue a STANDBY command can let chip go into low power standby mode. A WAKEUP command can wake up the chip and perform one time one-shot conversion. It will take  $t_{18}$  plus 3 nDRDY conversion cycles to wake up and fully settle the conversion data. After the conversion, if we want to go to standby again, another STANDBY command is needed. Figure 13 shows the sequence.

**Settling Time while Continuously Converting**

In the continuous mode, when there is a step change of the input, it usually needs several nDRDY periods to fully set up the data, which is shown in Table 14.

**Table 14. Data Settling Delay vs. Data Rate**

Data Rate (SPS)	Settling Time (nDRDY Periods)

**Data Format**

The SGM5860x output 24-bit data in binary two's complement format. The ideal output codes for different input signals are summarized as shown in Table 15.

**Table 15. Ideal Output Code for Different Input Signals**

Input Signal $V_{IN}$ ( $A_{INP} - A_{INN}$ )	Ideal Output Code <sup>(1)</sup>
$\geq \frac{+2V_{REF}}{PGA}$	7FFFFFFh
$\frac{+2V_{REF}}{PGA(2^{23} - 1)}$	000001h
0	000000h
$\frac{-2V_{REF}}{PGA(2^{23} - 1)}$	FFFFFFh
$\leq \frac{-2V_{REF}}{PGA} \left( \frac{2^{23}}{2^{23} - 1} \right)$	800000h

NOTE:

1. Except for effects of INL, noise, offset, and gain errors.

**General-Purpose Digital I/O (D0 to D3)**

The SGM58601 has 4 digital I/O pins and the SGM58600/2 have 2 digital I/O pins. All I/O pins are separately controllable by IO registers. During standby and power-down modes, the GPIOs are still active. If GPIOs work as output, they keep driving output. If the digital I/O pins are not used, either configure them as input and connect them to ground or configure them as outputs. This will reduce power dissipation.

**Clock Output (D0/CLKOUT)**

The clock output can be a clock source for other processor.

**Clock Generation**

The chip clock source can be an external oscillator (need an external crystal 7.68MHz), or an external clock source. When the source is an oscillator, two capacitors (typically 5pF to 20pF) are needed to connect both of oscillator's output pins to ground.

**Figure 13. One-Shot Conversions Using the STANDBY Command**

**DETAILED DESCRIPTION (continued)**

**Calibration**

The chip has offset calibration (OFCx) and gain calibration (FSCx) registers, which is used to compensate and minimize offset error and gain error of ADC results.

Offset errors are corrected with the offset calibration registers (OFCx) and gain errors are corrected with the full-scale calibration registers (FSCx).

The output of the SGM5860x after calibration is given by:

$$\text{Output} = \left( \frac{\text{PGA} \times V_{\text{IN}}}{2V_{\text{REF}}} \times \frac{3}{4} - \text{OFC} \right) \text{FSC} \tag{3}$$

OFC is a binary two's complement number, the ideal value is 0. FSC is unipolar, and the ideal number is 0x555555. OFC and FSC keep the same with different data rate settlings. For noise consideration, offset and full-scale errors can be calibrated at a lower data rate.

The SGM5860x provides chip self calibration and system calibration function (these are a series of command SELFOCAL, SELFGCAL, SELFCAL, SYSOCAL, and SYSGCAL). Once calibration is initiated, nDRDY goes high until the process is completed.

After a reset, the chip issue a chip self calibration automatically. Calibration should be performed after the buffer configuration or PGA changes.

**Self-Calibration**

The time required for self offset calibration for the different data rate settings is shown in Table 16. The calibration time is decreased with f<sub>CLKIN</sub> increasing. After a self-offset calibration, OFC registers is updated automatically.

The time required for self gain calibration under the different data rate and PGA settings is shown in Table 17. Self gain calibration can update the FSC registers.

**Table 16. Self Offset and System Offset Calibration Timing**

10	300.0ms	701.0ms
5	600.2ms	1400ms
2.5	1200ms	2800ms

NOTE: 1. f<sub>CLKIN</sub> = 7.68MHz.

## DETAILED DESCRIPTION (continued)

The time required for self-calibration under the different data rate settings is shown in Table 18. Self-calibration can update both the OFC and FSC registers.

**Table 18. Self-Calibration Timing**

Data Rate <sup>(1)</sup> (SPS)	PGA Setting	
	1, 2	4, 8, 16, 32, 64, 128
60000	447µs	890µs
30000	780µs	1.55ms
15000	1ms	2.09ms
7500	1.3ms	2.63ms
3750	1.8ms	3.7ms
2000	2.8ms	5.5ms
1000	4.8ms	9.5ms
500	8.8ms	17.5ms
100	40.8ms	81ms
60	67.4ms	134ms
50	80.8ms	161ms
30	134.1ms	268ms
25	160.8ms	322ms
15	267.2ms	534ms
10	400.6ms	800ms
5	800ms	1600ms
2.5	1600ms	3200ms

NOTE:

1.  $f_{CLKIN} = 7.68\text{MHz}$ .

### System Calibration

To perform a system offset calibration, the user must supply a zero input differential signal. The time required for system offset calibration under the different data rate settings is shown in Table 19. System offset calibration can update the OFC registers.

To perform a system gain calibration, the user must supply a full-scale input signal to the SGM5860x. The time required for system gain calibration under the different data rate settings is shown in Table 19. System gain calibration can update the FSC registers.

**Table 19. System Gain (Offset) Calibration Timing**

Data Rate <sup>(1)</sup> (SPS)	System Gain Calibration Time
60000	229µs
30000	400µs
15000	528µs
7500	667µs
3750	930µs
2000	1.4ms
1000	2.4ms
500	4.4ms
100	20.4ms
60	33.7ms
50	40.4ms
30	67.0ms
25	80.4ms
15	133.7ms
10	200.4ms
5	400.4ms
2.5	800.4ms

NOTE:

1.  $f_{CLKIN} = 7.68\text{MHz}$ .

### Auto-Calibration

Auto-calibration is allowed to enable (ACAL bit in STATUS register) when completing the write command (WREG).

### Serial Interface

The SGM5860x has an SPI-compatible interface, including nCS, SCLK, DIN and DOUT.

### Reset

There are two methods to reset the SGM5860x: the nRESET input pin and RESET command.

## **DETAILED DESCRIPTION (continued)**

### **Synchronization**

There are two kinds of ways to synchronize input sampling, SYNC command and nSYNC/nPDWN pin control. The first method is to shift in 8-bit SYNC command, this makes the chip ready to synchronize, and then issue WAKEUP command to synchronize the sampling of the input signal on the first rising edge of SCLK shifted in by WAKEUP. The second method is to pull nSYNC/nPDWN pin low and then set it high, synchronization happens on the rising edge of nSYNC/nPDWN.

### **Standby Mode**

In standby mode, the chip turns off all analog circuits and some of the digital circuits. The oscillator circuits still keep working. A WAKEUP command lets the chip exit standby mode. Details see Figure 13.

### **Power-Down Mode**

In power-down mode, all circuits are turned off, including oscillator and clock output. To enter power-down, set nSYNC/nPDWN pin low and keep it for 20 nDRDY cycles.

To get out of power-down mode, set the nSYNC/nPDWN pin high, it will take the chip about 30ms to wake up if an external crystal oscillator is used. It will take about 8192 CLKIN cycles to wake up if an external clock source is used.

### **Power-Up**

After a power-up, all registers is reset to their default values. And then a self-calibration is performed automatically. We still suggest that one more self-calibration by user's own control software before the system starts running.

## REGISTER MAPS

Table 20. Register Maps

Register Address	Register Name	Reset Value	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
00h	STATUS	x1h	ID[3:0]				ORDER	ACAL	BUFEN	nDRDY

05h	OFC0	xxh	OFC[7:0]							
06h	OFC1	xxh	OFC[15:8]							
07h	OFC2	xxh	OFC[23:16]							
08h	FSC0	xxh	FSC[7:0]							
09h	FSC1	xxh	FSC[15:8]							
0Ah	FSC2	xxh	FSC[23:16]							
0Bh	STATUS2	00h	Reserved				REF_BUF $\bar{P}$	REF_BUF $\bar{M}$	AIN_BUF $\bar{P}$	AIN_BUF $\bar{M}$

### STATUS: Status Register

Register address: 00h

Reset value = x1h

BITS	BIT NAME	DESCRIPTION	COMMENT	DEFAULT VALUE
D[7:4]	ID[3:0]	Factory Programmable Identification Bits	Read only.	0000
D[3]	ORDER	Data Output Bit Order 0 = Most significant bit first (default) 1 = Least significant bit first	ORDER setting has no effect on input data. Output data is always out by most significant byte firstly. ORDER setting only has effect on the shifting out sequence within byte.	0
D[2]	ACAL	Auto-Calibration 0 = Auto-calibration disabled (default) 1 = Auto-calibration enabled	When auto-calibration is enabled, self-calibration starts at the completion of the WREG command that changes the values of the PGA[2:0] bits in the ADCON register, DR[7:0] in the DRATE register or BUFEN bit in the STATUS register.	0
D[1]	BUFEN	Analog Input Buffer Enable 0 = Buffer disabled. Positive and negative buffers are controlled by AIN_BUF $\bar{P}$ and AIN_BUF $\bar{M}$ further (default) 1 = Buffer enabled. Positive and negative buffers are enabled no matter how AIN_BUF $\bar{P}$ , AIN_BUF $\bar{M}$ are		0
D[0]	nDRDY	Data Ready	Read only. This bit copies the status of nDRDY pin.	

## REGISTER MAPS (continued)

### MUX: Input Multiplexer Control Register

Register address: 01h

Reset value = 01h

BITS	BIT NAME	DESCRIPTION	COMMENT	DEFAULT VALUE
D[7:4]	PSEL[3:0]	Positive Input Channel (AIN <sub>P</sub> ) Select 0000 = AIN0 (SGM5860x) (default) 0001 = AIN1 (SGM5860x) 0010 = AIN2 (SGM58601/2 only) 0011 = AIN3 (SGM58601/2 only) 0100 = AIN4 (SGM58601 only) 0101 = AIN5 (SGM58601 only) 0110 = AIN6 (SGM58601 only) 0111 = AIN7 (SGM58601 only) 1xxx = AINCOM (SGM58600/1 only)	Ensure only available inputs are selected when using the SGM58600. When PSEL[3] = 1, PSEL[2], PSEL[1], PSEL[0] are don't care.	0000
D[3:0]	NSEL[3:0]	Negative Input Channel (AIN <sub>N</sub> ) Select 0000 = AIN0 (SGM5860x) 0001 = AIN1 (SGM5860x) (default) 0010 = AIN2 (SGM58601/2 only) 0011 = AIN3 (SGM58601/2 only) 0100 = AIN4 (SGM58601 only) 0101 = AIN5 (SGM58601 only) 0110 = AIN6 (SGM58601 only) 0111 = AIN7 (SGM58601 only) 1xxx = AINCOM (SGM58600/1 only)	Ensure to only select the available inputs when using the SGM58600. When NSEL[3] = 1, NSEL[2], NSEL[1], NSEL[0] are don't care.	0001

### ADCON: A/D Control Register

Register address: 02h

Reset value = 20h

BITS	BIT NAME	DESCRIPTION	COMMENT	DEFAULT VALUE
D[7]	Reserved	Reserved. Always 0.	Read only.	0
D[6:5]	CLK[1:0]	D0/CLKOUT Clock Out Rate 00 = Clock out off 01 = Clock out frequency = $f_{CLKIN}$ (default) 10 = Clock out frequency = $f_{CLKIN}/2$ 11 = Clock out frequency = $f_{CLKIN}/4$	When CLKOUT is not used, it is recommended to turn it off.	01
D[4:3]	SDCS[1:0]	Sensor Detection Current Sources 00 = Sensor detection off (default) 01 = Sensor detection current = 0.5 $\mu$ A 10 = Sensor detection current = 2 $\mu$ A 11 = Sensor detection current = 9 $\mu$ A		00
D[2:0]	PGA[2:0]	Programmable Gain Amplifier 000 = 1 (default) 001 = 2 010 = 4 011 = 8 100 = 16 101 = 32 110 = 64 111 = 128		000

**REGISTER MAPS (continued)**

**DRATE: A/D Data Rate Register**

Register address: 03h

Reset value = F0h

BITS	BIT NAME	DESCRIPTION	COMMENT	DEFAULT VALUE
D[7:0]	DR[7:0]	Data Rate 11110001 = 6000SPS 11110000 = 3000SPS (default) 11100000 = 1500SPS 11010000 = 750SPS 11000000 = 375SPS 10110000 = 2000SPS 10100001 = 1000SPS 10010010 = 500SPS 10000010 = 100SPS 01110010 = 60SPS 01100011 = 50SPS 01010011 = 30SPS 01000011 = 25SPS 00110011 = 15SPS 00100011 = 10SPS 00010011 = 5SPS 00000011 = 2.5SPS	The 17 valid data rate settings are shown in the table.	11110000

**IO: GPIO Control Register**

Register address: 04h

Reset value = E0h

BITS	BIT NAME	DESCRIPTION	COMMENT	DEFAULT VALUE
D[7:4]	DIR[3:0]	DIR[3] Digital I/O Direction for Pin D3 0 = It's an output 1 = It's an input (default)	For SGM58601 only.	1
		DIR[2] Digital I/O Direction for Pin D2 0 = It's an output 1 = It's an input (default)	For SGM58601 only.	1
		DIR[1] Digital I/O Direction for Pin D1 0 = It's an output 1 = It's an input (default)		1
		DIR[0] Digital I/O Direction for Pin D0/CLKOUT 0 = It's an output (default) 1 = It's an input		0
D[3:0]	DIO[3:0]	Status of Digital I/O Pins D3, D2, D1, D0/CLKOUT	It's used for GPIO pins data read and write. When the GPIO pin is an input configuration, a write operation has no effect on it. A read operation is effective on both input pins and output pins. When D0/CLKOUT is used for clock output, DIO[0] setting has no effect.	0000

## REGISTER MAPS (continued)

### OFC0: Offset Calibration Byte 0 - Least Significant Byte

D[0]	AIN_BUFPM	Negative Analog Input Buffer Enable 0 = Buffer disabled (default) 1 = Buffer enabled	Functions when BUFEN = 0.	0

## COMMAND DEFINITIONS

Table 21 summarizes the commands that control the operation of the SGM5860x. All commands are single byte excluding RREG and WREG.

**Table 21. Command Definitions**

Command	Description	First Command Byte	Second Command Byte
WAKEUP	Complete SYNC and Exit Standby Mode	0000 0000 (00h)	
RDATA <sup>(2)</sup>	Read Data	0000 0001 (01h)	
RDATA <sup>C</sup> <sup>(2)</sup>	Read Data Continuous	0000 0011 (03h)	
SDATA <sup>C</sup> <sup>(2)</sup>	Stop Read Data Continuous	0000 1111 (0Fh)	
RREG	Read from Register ssss	0001 ssss (1xh)	0000 qqqq
WREG	Write to Register ssss	0101 ssss (5xh)	0000 qqqq
SELFCAL	Offset and Gain Self-Calibration	1111 0000 (F0h)	
SELFOCAL	Offset Self-Calibration	1111 0001 (F1h)	
SELFGCAL	Gain Self-Calibration	1111 0010 (F2h)	
YSOCAL	System Offset Calibration	1111 0011 (F3h)	
YSGCAL	System Gain Calibration	1111 0100 (F4h)	
SYNC	Synchronize the A/D Conversion	1111 1100 (FCh)	
STANDBY	Begin Standby Mode	1111 1101 (FDh)	
RESET <sup>(2)</sup>	Reset to Power-Up Values	1111 1110 (FEh)	
WAKEUP	Complete SYNC and Exit Standby Mode	1111 1111 (FFh)	

NOTE:

1. qqqq = number of registers to be read/written - 1. For example, to read/write three registers, set qqqq = 0b0010. ssss = starting register address for read/write commands.
2. Issue this command after nDRDY goes low.

### **SELFCAL: Offset and Gain Self-Calibration**

Issue an offset and gain self-calibration command. When the calibration starts, nDRDY goes high. When the calibration completes, nDRDY goes low, and settled data is ready. Do not perform any more operation during this calibration.

### **SELFOCAL: Offset Self-Calibration**

Issue an offset self-calibration command. When beginning the calibration, nDRDY goes high. When the calibration completes, nDRDY goes low, and settled data is ready. Do not do any more operation during this calibration.

### **SELFGCAL: Gain Self-Calibration**

Issue a gain self-calibration command. When beginning the calibration, nDRDY goes high. When the calibration completes, nDRDY goes low, and settled data is ready. Do not do any more operation during this calibration.

### **YSOCAL: System Offset Calibration**

Issue a system offset calibration command. When beginning the calibration, nDRDY goes high. When the calibration completes, nDRDY goes low, and settled data is ready. Do not do any more operation during this calibration.

### **YSGCAL: System Gain Calibration**

Issue a system gain calibration command. When beginning the calibration, nDRDY goes high. When the calibration completes, nDRDY goes low, and settled data is ready. Do not do any more operation during this calibration.

### **RESET: Reset Registers to Default Values**

Reset all registers to default values except CLK[1:0] setting (which is in ADCON register).

**COMMAND DEFINITIONS (continued)**

**WAKEUP: Complete SYNC or Exit Standby Mode**

The WAKEUP command is used in conjunction with the SYNC and STANDBY commands. It provides two values: all zeros or all ones.

**RDATAAC: Read Data Continuous**

When nDRDY is low, issue the RDATAAC command, the chip will give out ADC conversion results continuously, see details in Figure 14.

**Figure 14. RDATAAC Command Sequence**
