**OVERSTRESS CAUTION**

Stresses beyond those listed in Absolute Maximum Ratings may cause permanent damage to the device. Exposure to absolute maximum rating conditions for extended periods may affect reliability. Functional operation of the device at any conditions beyond those indicated in the Recommended Operating Conditions section is not implied.

**ESD SENSITIVITY CAUTION**

This integrated circuit can be damaged if ESD protections are not considered carefully. SGMICRO recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage. ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because even small parametric changes could cause the device not to meet the published specifications.

## NOTES:

1. The dropout voltage is defined as the difference between  $V_{IN}$  and  $V_{OUT}$  when  $V_{OUT}$  falls to  $95\% \times V_{OUT(NOM)}$ .
2. Reverse leakage current is the current flows from the output to the input when  $V_{OUT} > V_{IN}$ .
3. Output voltage temperature coefficient is defined as the worst-case voltage change divided by the total temperature range.

APPLICATION INFORMATION

Input Capacitor Selection (C<sub>IN</sub>)

The input decoupling capacitor is necessary to be connected as close as possible to the IN pin for ensuring the device stability. 1µF or larger X7R or X5R ceramic capacitor is selected to get good dynamic performance.

When V<sub>IN</sub> is required to provide large current instantaneously, a large effective input capacitor is required. Multiple input capacitors can limit the input tracking inductance. Adding more input capacitors is available to restrict the ringing and to keep it below the device absolute maximum ratings.

Output Capacitor Selection (C<sub>OUT</sub>)

The output decoupling capacitor should be located as close as possible to the OUT pin. 0.22µF or larger X7R or X5R ceramic capacitor is selected to get good dynamic performance. The minimum effective capacitance of C<sub>OUT</sub> that SGM2034 can remain stable is 0.1µF. For ceramic capacitor, temperature, DC bias and package size will change the effective capacitance, so enough margin of C<sub>OUT</sub> must be considered in design. Larger capacitance and lower ESR C<sub>OUT</sub> will

help improve the load transient response and increase the high frequency PSRR.

Output Current Limit and Short-Circuit Protection

When overload events happen, the output current is internally limited to 480mA (TYP). When the OUT pin is shorted to ground, the short-circuit protection will limit the output current to 100mA (TYP).

Reverse Current Protection

The SGM2034 incorporates reverse current protection circuit that prevents current flow backwards through the pass element when the output voltage is greater than the input voltage. A comparator senses the difference between the input and output voltages. When the difference between the output voltage and input voltage exceeds 800mV (TYP), the gate of the PFET is switched to V<sub>OUT</sub> and the PFET is turned off. Otherwise, the gate voltage of the PFET is unfixed, and the reverse current may be (V<sub>OUT</sub> - V<sub>IN</sub>) / R<sub>ON</sub>, R<sub>ON</sub> = V<sub>DROP</sub> / I<sub>OUT</sub>.
