

SGM8608-2

11MHz, Rail-to-Rail I/O

CMOS Operational Amplifier

GENERAL DESCRIPTION

The SGM8608-2 is a low noise, low power operational amplifier optimized for low voltage operation. The device can operate from 2.1V to 5.5V single supply, and consumes only 1.1mA quiescent current per amplifier at 5V.

The SGM8608-2 features a 1.7mV maximum input offset voltage. The minimum input common mode voltage is within 0.1V below the negative rail, and the output swing is rail-to-rail with heavy loads. It exhibits a high gain-bandwidth product of 11MHz and a slew rate of 6.6V/ μ s. These specifications make the operational amplifier appropriate for a wide range of applications.

The SGM8608-2 is available in Green SOIC-8, MSOP-8, TSSOP-8 and UTDFN-2x2-8BL packages. It is specified over the extended industrial temperature range (-40°C to +125°C).

FEATURES

- Input Offset Voltage: 1.7mV (MAX)
- High Gain-Bandwidth Product: 11MHz
- High Slew Rate: 6.6V/ μ s
- Settling Time to 0.1% with 2V Step: 500ns
- Overload Recovery Time: 0.16 μ s
- Low Noise: 12nV/ $\sqrt{\text{Hz}}$ at 10kHz
- Rail-to-Rail Input and Output
- Supply Voltage Range: 2.1V to 5.5V
- Input Voltage Range: -0.1V to 5.6V with $V_S = 5.5V$
- Low Power: 1.1mA/Amplifier (TYP)
- -40°C to +125°C Operating Temperature Range
- Available in Green SOIC-8, MSOP-8, TSSOP-8 and UTDFN-2x2-8BL Packages

APPLICATIONS

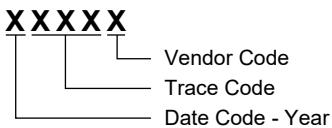

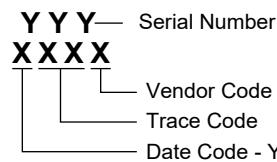

- Sensors
- Audio
- Active Filters
- A/D Converters
- Communications
- Test Equipment
- Cellular and Cordless Phones
- Laptops and PDAs
- Photodiode Amplification
- Battery-Powered Instrumentation

PACKAGE/ORDERING INFORMATION

Green (RoHS & HSF): SG Micro Corp defines "Green" to mean Pb-Free (RoHS compatible) and free of halogen substances. If you have additional comments or questions, please contact your SGMICRO representative directly.

ABSOLUTE MAXIMUM RATINGS

Supply Voltage, +Vs to -Vs	6V
Input Common Mode Voltage Range	(-Vs) - 0.3V to (+Vs) + 0.3V
Junction Temperature	+150°C
Storage Temperature Range	-65°C to +150°C
Lead Temperature (Soldering, 10s)	+260°C
ESD Susceptibility	
HBM	8000V
CDM	1000V

RECOMMENDED OPERATING CONDITIONS

Operating Temperature Range -40°C to +125°C

OVERSTRESS CAUTION

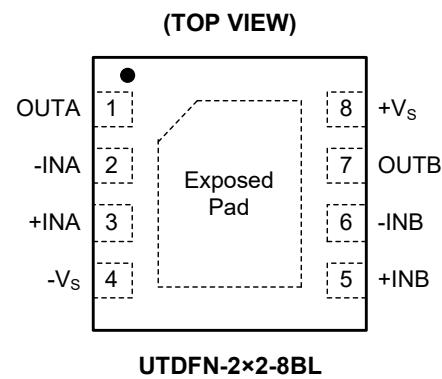

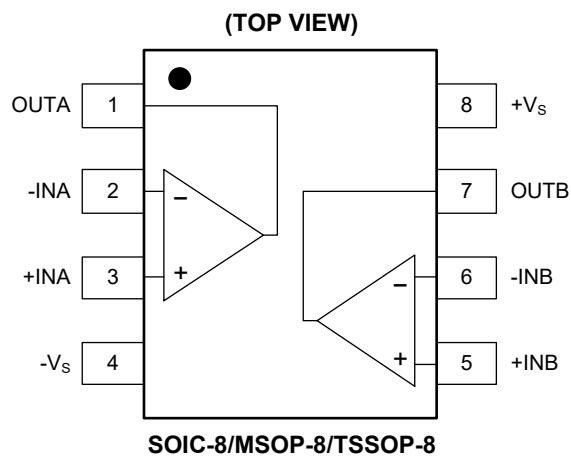

Stresses beyond those listed in Absolute Maximum Ratings may cause permanent damage to the device. Exposure to absolute maximum rating conditions for extended periods may affect reliability. Functional operation of the device at any conditions beyond those indicated in the Recommended Operating Conditions section is not implied.

ESD SENSITIVITY CAUTION

This integrated circuit can be damaged if ESD protections are not considered carefully. SGMICRO recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage. ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because even small parametric changes could cause the device not to meet the published specifications.

DISCLAIMER

SG Micro Corp reserves the right to make any change in circuit design, or specifications without prior notice.

PIN CONFIGURATIONS

NOTE: For the UTDFN-2x2-8BL package, the exposed pad is not internally connected and can be set to ground or left floating.

ELECTRICAL CHARACTERISTICS

(For V_S (Total Supply Voltage) = $(+V_S) - (-V_S)$ = 2.1V to 5.5V, $V_{CM} = V_S/2$, $V_{OUT} = V_S/2$, and $R_L = 600\Omega$ connected to $V_S/2$, Full = -40°C to +125°C, typical values are at $T_A = +25^\circ C$, unless otherwise noted.)

APPLICATION INFORMATION

Rail-to-Rail Output

The SGM8608-2 supports rail-to-rail output operation. In single power supply application, for example, when $+V_S = 5.5V$, $-V_S = GND$, $10k\Omega$ load resistor is tied from OUT pin to $V_S/2$, the typical output swing range is from 0.004V to 5.496V.

Driving Capacitive Loads

The SGM8608-2 is designed for unity-gain stable for capacitive load up to 2200pF. If greater capacitive load must be driven in application, the circuit in Figure 1 can be used. In this circuit, the IR drop voltage generated by R_{ISO} is compensated by feedback loop.

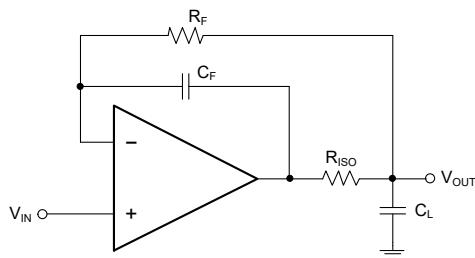

Figure 1. Circuit to Drive Heavy Capacitive Load

Power Supply Decoupling and Layout

A clean and low noise power supply is very important in amplifier circuit design, besides of input signal noise, the power supply is one of important source of noise to the amplifier through $+V_S$ and $-V_S$ pins. Power supply bypassing is an effective method to clear up the noise at power supply, and the low impedance path to ground of decoupling capacitor will bypass the noise to GND. In application, $10\mu F$ ceramic capacitor paralleled with $0.1\mu F$ or $0.01\mu F$ ceramic capacitor is used in Figure 2. The ceramic capacitors should be placed as close as possible to $+V_S$ and $-V_S$ power supply pins.

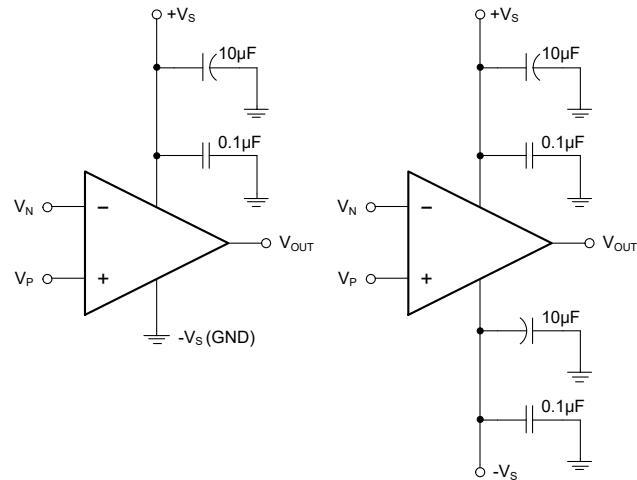

Figure 2. Amplifier Power Supply Bypassing

Grounding

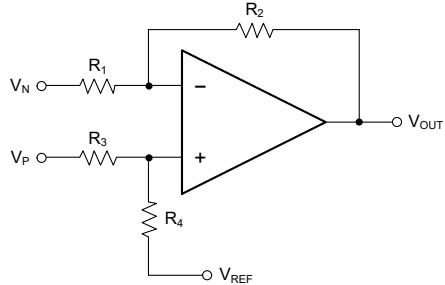

In low speed application, one node grounding technique is the simplest and most effective method to eliminate the noise generated by grounding. In high speed application, the general method to eliminate noise is to use a complete ground plane technique, and the whole ground plane will help distribute heat and reduce EMI noise pickup.

Reduce Input-to-Output Coupling

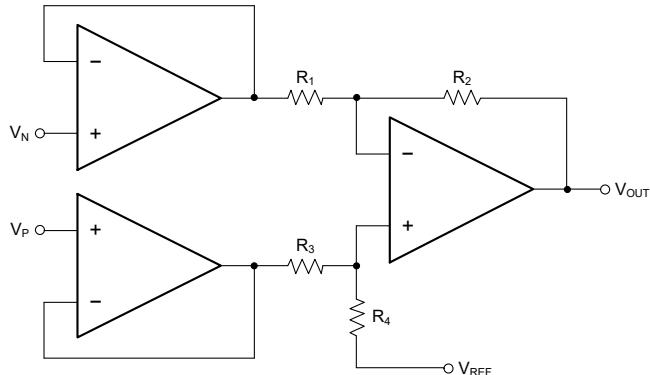

To reduce the input-to-output coupling, the input traces must be placed as far away from the power supply or output traces as possible. The sensitive trace must not be placed in parallel with the noisy trace in same layer. They must be placed perpendicularly in different layers to reduce the crosstalk. These PCB layout techniques will help to reduce unwanted positive feedback and noise.

APPLICATION INFORMATION (continued)**Typical Application Circuits****Difference Amplifier**

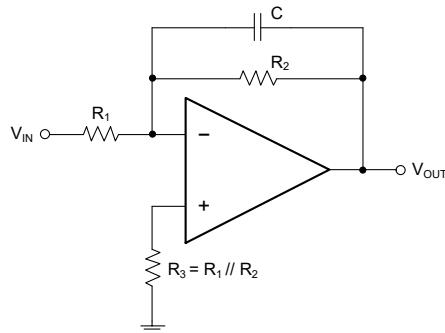

The circuit in Figure 3 is a design example of classical difference amplifier. If $R_4/R_3 = R_2/R_1$, then $V_{OUT} = (V_P - V_N) \times R_2/R_1 + V_{REF}$.

**Figure 3. Difference Amplifier****High Input Impedance Difference Amplifier**

The circuit in Figure 4 is a design example of high input impedance difference amplifier, the added amplifiers at the input are used to increase the input impedance and eliminate drawback of low input impedance in Figure 3.

**Figure 4. High Input Impedance Difference Amplifier****Active Low-Pass Filter**

The circuit in Figure 5 is a design example of active low-pass filter, the DC gain is equal to $-R_2/R_1$ and the -3dB corner frequency is equal to $1/2\pi R_2 C$. In this design, the filter bandwidth must be less than the bandwidth of the amplifier, the resistor values must be selected as low as possible to reduce ringing or oscillation generated by the parasitic parameters in PCB layout.

**Figure 5. Active Low-Pass Filter**
