

### GENERAL DESCRIPTION

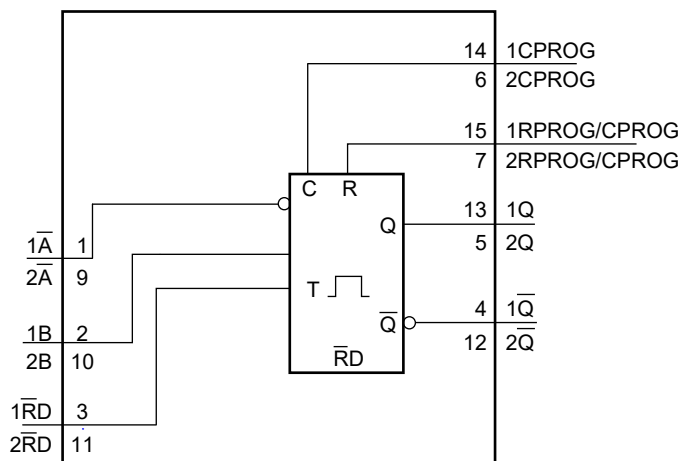

The 74AHC123 is a high-speed Si-gate CMOS device. It is a dual retriggerable monostable multivibrator.

The device has three ways of output pulse-duration control. First, when  $n\bar{A}$  input sets low, the  $nB$  input goes high. Second, when  $nB$  input sets high, the  $n\bar{A}$  input goes low. Third, when  $n\bar{A}$  input sets low and  $nB$  input sets high, the  $n\bar{RD}$  input goes high. Figure 3 shows the output pulse control using retrigger pulse and Figure 4 illustrates the output pulse control using reset input  $n\bar{RD}$ .

The output pulse-duration can be set through the selection of external resistance ( $R_{PROG}$ ) and capacitance ( $C_{PROG}$ ) values. All of the inputs have Schmitt-trigger actions with sufficient hysteresis to handle slow input rise and fall times.

When started, the gated active low-going edge ( $n\bar{A}$ ) input or the active high-going edge ( $nB$ ) input can help to prolong the basic output pulse-duration. Through it, an ideal output pulse period ( $nQ = \text{high}$ ,  $n\bar{Q} = \text{low}$ ) can be achieved. Pulse duration can be reduced by a low-going edge on  $n\bar{RD}$  input.

### LOGIC DIAGRAM

### FEATURES

- **Supply Voltage Range: 2.0V to 5.5V**
- **Inputs Accept Voltages Higher than the Supply Voltage**
- **All Inputs with Schmitt-Trigger Actions**
- **Triggered from Gated Active High or Active Low Edge Inputs**
- **Retriggerable for Very Long Pulses**
- **Direct Reset Stops Output Pulse**
- **CMOS Level Inputs**
- **-40°C to +125°C Operating Temperature Range**
- **Available in Green SOIC-16 and TSSOP-16 Packages**

### FUNCTION TABLE

H = High Voltage Level

L = Low Voltage Level

↑ = Low-to-High Transition

↓ = High-to-Low Transition

⌊ = One High Level Output Pulse

⌋ = One Low Level Output Pulse

X = Don't Care

\* If the monostable multivibrator starts without this condition, the pulse will continue as set.

## OVERSTRESS CAUTION

1. Stresses beyond those listed in Absolute Maximum Ratings may cause permanent damage to the device. Exposure to absolute maximum rating conditions for extended periods may affect reliability. Functional operation of the device at any conditions beyond those indicated in the Recommended Operating Conditions section is not implied.
2. The input and output voltage ratings may be exceeded if the input and output clamp current ratings are observed.
3. The performance capability of a high-performance integrated circuit in conjunction with its thermal environment can create junction temperatures which are detrimental to reliability.

## ESD SENSITIVITY CAUTION

This integrated circuit can be damaged if ESD protections are not considered carefully. SGMICRO recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage. ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because even small parametric changes could cause the device not to meet the published specifications.

## DISCLAIMER

SG Micro Corp reserves the right to make any change in circuit design, or specifications without prior notice.

## PIN CONFIGURATION

## PIN DESCRIPTION

PIN	NAME	FUNCTION
1, 9	1 $\bar{A}$ , 2 $\bar{A}$	Negative-Edge Triggered Inputs.
2, 10	1B, 2B	Positive-Edge Triggered Inputs.
3, 11	1 $\bar{R}D$ , 2 $\bar{R}D$	Direct Reset Low and Positive-Edge Triggered Inputs.
4, 12	1 $\bar{Q}$ , 2 $\bar{Q}$	Active Low Outputs.

## NOTES:

- Specified by design and characterization; not production tested.
- $t_{PD}$  is the same as  $t_{PLH}$  and  $t_{PHL}$ .
- For  $C_{PROG} \geq 10\text{nF}$ , typical  $t_W$  ( $\mu\text{s}$ ) =  $C_{PROG}$  (nF)  $\times$   $R_{PROG}$  (k $\Omega$ ).
- $C_{PD}$  is used to determine the dynamic power dissipation (PD in  $\mu\text{W}$ ).  $P_D = C_{PD} \times V_{CC}^2 \times f_i + \Sigma(C_L \times V_{CC}^2 \times f_o)$   
where:  $f_i$  = Input frequency in MHz;  $f_o$  = Output frequency in MHz;  $C_L$  = Output load capacitance in pF;  $V_{CC}$  = Supply voltage in Volts;  $\Sigma(C_L \times V_{CC}^2 \times f_o)$  = Sum of outputs.
- There is no limitation on  $C_{PROG}$ .

TEST CIRCUIT

Test conditions are given in Table 1.

Definitions for test circuit:

$R_L$ : Load resistance.

$C_L$ : Load capacitance (includes jig and probe).

$R_T$ : Termination resistance (equals to output impedance  $Z_O$  of the pulse generator).

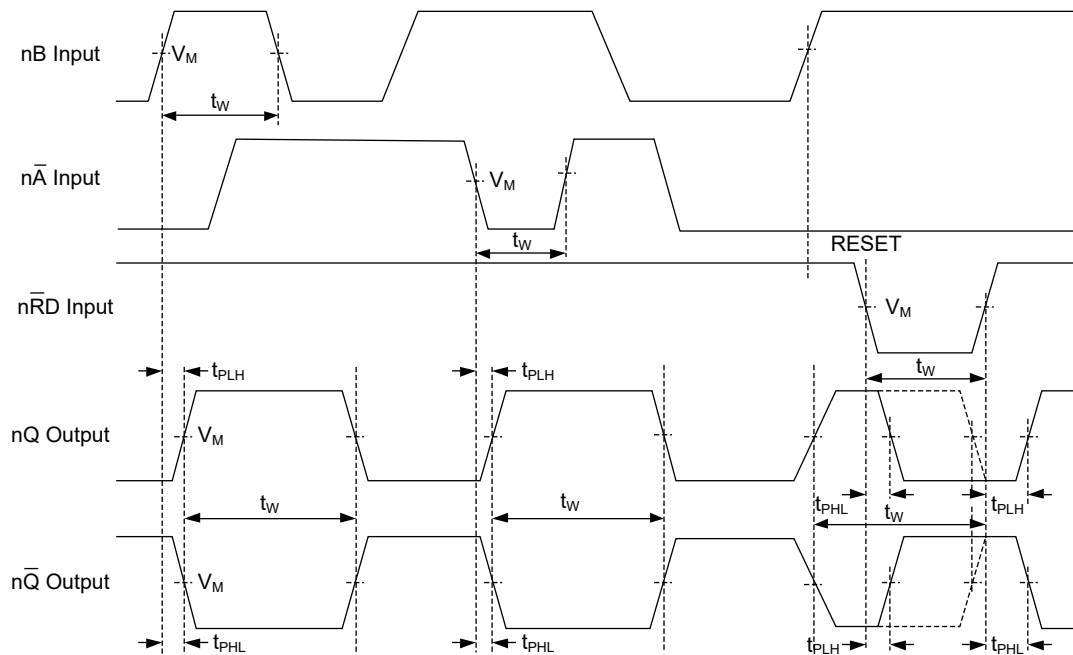

S1: Test selection switch.
