

## Low voltage three phase and three sense motor driver

Datasheet - production data

### Description

The STSPIN233 device integrates a triple half-bridge low  $R_{DS(ON)}$  power stage in a small VFQFPN 3 x 3 x 1.0 mm package ideal for small and space constrained applications.

The device is designed to operate in battery-powered scenarios and can be forced in a zero consumption state, allowing a significant increase in battery life.

The STSPIN233 is supporting three shunt sensing topology.

The device offers a complete set of protection including overcurrent, overtemperature and short-circuit protection.

### Features

- Operating voltage from 1.8 to 10 V
- Maximum output current 1.3 Arms
- $R_{DS(ON)}$  HS + LS = 0.4  $\Omega$  typ.
- Full protection set
  - Non-dissipative overcurrent protection
  - Short-circuit protection
  - Thermal shutdown
- Supporting three shunt sensing topology
- Direct driving, dedicated input and enable pin for each half-bridge
- Energy saving and long battery life with standby consumption less than 80 nA

### Applications

- Battery-powered 3-phase brushless (BLDC) motors in applications such as
  - Drones and portable gimbals
  - Portable health care products
  - Low voltage electronic valves
  - Portable medical equipment
  - Toys
  - Robotics

## 6 Description

The STSPIN233 device is a protected triple half-bridge motor driver.

### 6.1 Standby and power-up

The device provides a low consumption mode which is set forcing the STBY\RESET input below the  $V_{STBYL}$  threshold.

When the device is in the standby status the power stage is disabled (outputs are in high impedance) and the supply to the integrated control circuitry is cut off. When the device leaves the standby status, all the control circuitry is reset at power-up condition.

### 6.2 Motor driving

The outputs of the three half-bridges are directly driven through the logic input as listed in [Table 8](#).

**Table 8. ENx and INx truth table**

EN\FAULT	ENx	INx	OUTx	'x' half-bridge condition
0	X	X	HiZ	Disabled
1	0	X	HiZ	Disabled
1	1	0	GND	Low side MOSFET ON
1	1	1	VS	High side MOSFET ON

### 6.3 Overcurrent and short-circuit protections

The device embeds a circuitry protecting each power output against the overload and short-circuit conditions (short-circuit to ground, short-circuit to VS and short-circuit between outputs).

When the overcurrent or the short-circuit protection is triggered, the power stage is disabled and the EN\FAULT input is forced low through the integrated open-drain MOSFET discharging the external  $C_{EN}$  capacitor (refer to [Figure 4](#)).

The power stage is kept disabled and the open-drain MOSFET is kept ON until the EN\FAULT input falls below the  $V_{RELEASE}$  threshold, then the  $C_{EN}$  capacitor is charged through the  $R_{EN}$  resistor.

Figure 4. Overcurrent and short-circuit protections management

The total disable time after an overcurrent event can be set sizing properly the external network connected to the EN/FAULT pin (refer to [Figure 4](#)).

**Equation 1**

$$t_{DIS} = t_{discharge} + t_{charge}$$

But  $t_{charge}$  is normally very higher than  $t_{discharge}$ , we can consider only the second one contribution:

**Equation 2**

$$t_{DIS} \cong R_{EN} \cdot C_{EN} \cdot \ln \frac{(V_{DD} - R_{EN} \cdot I_{PD}) - V_{RELEASE}}{(V_{DD} - R_{EN} \cdot I_{PD}) - V_{IH}}$$

Where  $V_{DD}$  is the pull-up voltage of the  $R_{EN}$  resistor.

Figure 5. Disable time versus  $R_{EN}$  and  $C_{EN}$  values ( $V_{DD} = 3.3\text{ V}$ )

Figure 6. Disable time versus  $R_{EN}$  and  $C_{EN}$  values ( $V_{DD} = 1.8\text{ V}$ )

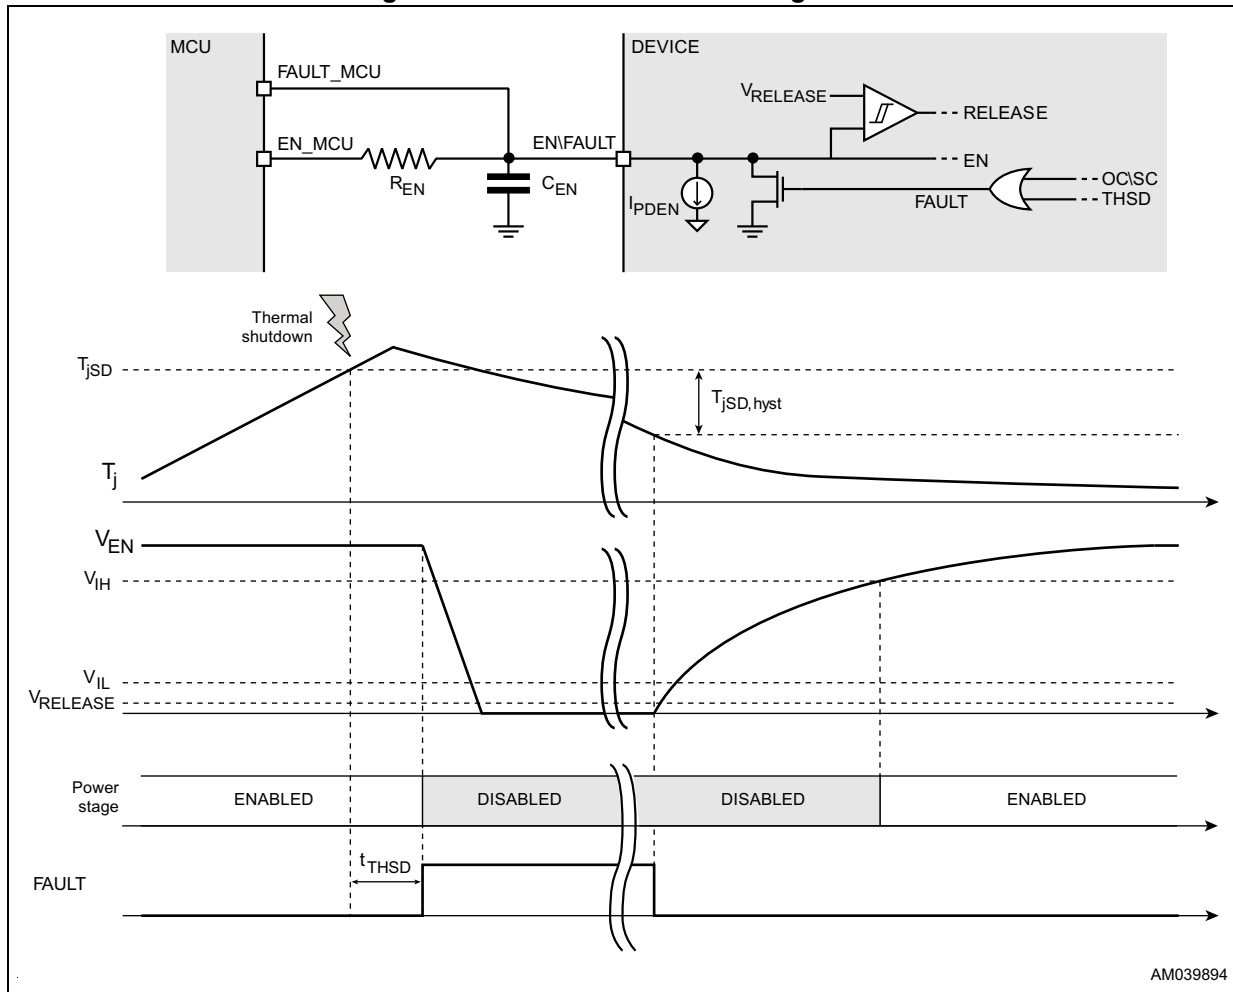

### 6.4 Thermal shutdown

The device embeds circuitry protecting it from the overtemperature condition.

When the thermal shutdown temperature is reached, the power stage is disabled and the EN\FAULT input is forced low through the integrated open-drain MOSFET (refer to [Figure 7](#)).

The protection and the EN\FAULT output are released when the IC temperature returns below a safe operating value ( $T_{jSD} - T_{jSD,Hyst}$ ).

1. VFQFPN stands for thermally enhanced “Very thin Fine pitch Quad Packages No lead”. Very thin:  $0.80 < A \leq 1.00$  mm / fine pitch:  $e < 1.00$  mm. The topside terminal A1 indicator may be a molded or metalized feature. The optional indicator on the bottom surface may be a molded, marked or metalized feature.
2. A1 is defined as the distance from the seating plane to the lowest point on the package body (standoff).
3. Dimensions “b” and “L” are measured at terminal plating surface.
