

## 400 mA nano-quiescent synchronous step-down converter with digital voltage selection and Power Good

Flip-Chip8 (1.14x1.44 mm)

### Features

- 500 nA input quiescent current at  $V_{IN}=3.6$  V (not switching)
- 94% typical efficiency at 1 mA load ( $V_{IN}=3.6$  V,  $V_{OUT}=3.3$  V)
- 100% duty cycle
- 1.8 V to 5.5 V input operating range
- Undervoltage lockout: 1.57 V ( $V_{IN}$  falling, typ.)
- Up to 400 mA output current capability
- Low power control operation for the best efficiency
- Embedded soft-start circuit
- Tiny external components: L=2.2  $\mu$ H typ.
- Selectable output voltages: 0.625 V to 3.3 V
- Output voltage Power Good
- $\pm 1.5\%$  output voltage accuracy ( $V_{OUT}$ ,  $T_A = 25$  °C)
- Dynamic output voltage selection (D0, D1)
- Available in Flip-Chip package

### Applications

- Wearable applications
- Personal tracking monitors
- Smart watches, sport bands
- Energy harvesting, wireless sensors
- Wearable and fitness accessories
- Industrial sensors, portable low power devices
- Single cell Li-Ion battery applications
- Bluetooth® low energy
- Zigbee

#### Product status link

ST1PS01

### Description

The ST1PS01 is a nano-quiescent miniaturized synchronous step-down converter, which is able to provide up to 400 mA output current with an input voltage ranging from 1.8 V to 5.5 V.

This converter is specifically designed for applications where high efficiency, PCB size and thickness are the key factors. The output voltage can be set using two digital control inputs, a  $V_{OUT}$  from 0.625 V to 3.3 V can be dynamically selected. Thanks to the enhanced PCC (peak current control) the ST1PS01 reaches very high efficiency conversion using just a 2.2  $\mu$ H inductor and two small capacitors. Advanced design circuitry is implemented to minimize the quiescent current. The device is available in Flip-Chip package.

## 1 Application schematic

Figure 1. ST1PS01 application schematic

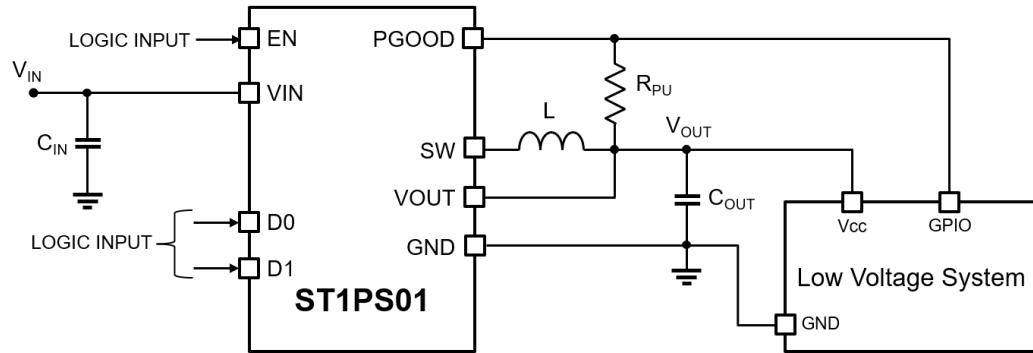

Table 1. Typical external components

Component	Description	Value	Size - imperial (metric)
C <sub>IN</sub>	Ceramic capacitor with low ESR values	10 $\mu$ F	0603 (1608)
C <sub>OUT</sub>	Ceramic capacitor with low ESR values	10 $\mu$ F	0603 (1608)
L	Inductor	2.2 $\mu$ H	0806 (2016)
R <sub>PU</sub>	Pull-up resistor	1 M $\Omega$	0402 (1005)

## 2 Pin configuration

Figure 2. Flip-Chip8 package (top through view)

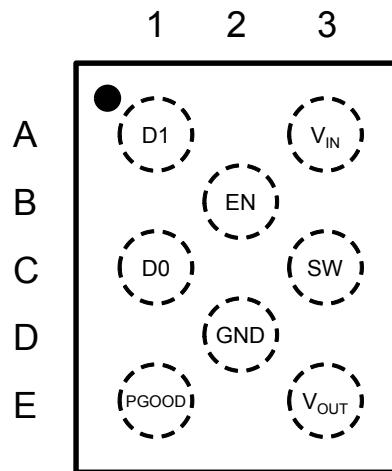

Table 2. Pin description

Name	Bump name	Description
V <sub>IN</sub>	A3	Input supply voltage. Bypass this pin to ground with a 10 $\mu$ F capacitor
SW	C3	Switching output. Inductor connection
V <sub>OUT</sub>	E3	Sense pin used to monitor output voltage
EN	B2	Enable pin. High logic level turns on the IC. V <sub>IN</sub> referred
GND	D2	Ground
D1	A1	Output voltage selection inputs (Refer to the Section 5)
D0	C1	
PGOOD	E1	Open drain output. It is in high impedance when the output voltage reaches 97.5% of the target V <sub>OUT</sub>

## 3 Functional pin description

### **GND**

Device ground pin.

### **VIN**

Supply voltage. This pin supplies power to the internal analog and digital circuitries when voltage is higher than  $V_{UVLO}$ . Bypass this pin to GND with a 10  $\mu$ F ceramic capacitor. Input capacitor  $C_{IN}$  must be chosen with low ESR to reduce the input voltage ripple.

### **SW**

Inductor connection to internal PMOS and NMOS switches.

### **VOUT**

Output voltage sense input. It provides the feedback voltage level to the regulation circuitry. 10  $\mu$ F output capacitor  $C_{OUT}$  must be connected close to the pin or through a short trace and should have low ESR to reduce the output voltage ripple.

### **EN**

Enable pin. A logic low level on this pin disables the device. High level enables the device. Do not leave this pin floating.

### **D0, D1**

Output voltage selection pins. See the Section 5 for  $V_{OUT}$  selection. Do not leave these pins floating. These pins can be dynamically changed during operation.

### **PGOOD**

Power Good open drain output. If used it requires a pull-up resistor to hold a high level signal. High impedance indicates that  $V_{OUT}$  is above proper good threshold.

## 4 Maximum ratings

**Table 3. Absolute maximum ratings**

Symbol	Parameter	Value	Unit
$V_{IN}$	Power and signal supply voltage	- 0.3 to + 6.5	V
EN, D0, D1	Logic input pins	- 0.3 to + 6.5	V
$V_{OUT}, SW$	Output signal monitoring and switching pins	-0.3 to $V_{IN} + 0.3$	V
PGOOD	Power Good open drain output pin	- 0.3 to + 6.5	V
$T_{AMB}$	Operating ambient temperature	-40 to 85	°C
$T_J$	Junction temperature	-40 to 125	°C
$T_{STG}$	Storage temperature	-55 to 150	°C

**Note:** *Absolute maximum ratings are those values beyond which damage to the device may occur. Functional operation under these conditions is not implied*

**Table 4. Thermal data**

Symbol	Parameter	Flip-Chip8	Unit
$R_{thJA}$	Thermal resistance junction-ambient	60	°C/W

**Table 5. Recommended operating conditions**

Symbol	Parameter	Min.	Typ.	Max.	Unit
$V_{IN}$	Input supply voltage	1.8		5.5	V

## 5 Electrical characteristics

$C_{IN} = 10 \mu F$ ,  $C_{OUT} = 10 \mu F$ ,  $L = 2.2 \mu H$ ,  $R_{PU} = 1 MOhm$ ,  $V_{IN} = 3.6 V$ ,  $V_{EN} = V_{IN}$ ,  $V_{OUT} = 1.8 V$ ,  $T_A = 25^\circ C$  unless otherwise specified.

**Table 6. Electrical characteristics**

Symbol	Parameter	Test conditions	Min.	Typ.	Max.	Unit
<b>General section</b>						
IQ	Quiescent current	$EN = V_{IN}$ , device does not switch ( $V_{OUT}$ pin voltage > $V_{OUT}$ setting value), $V_{IN} = V_{OUT\_min.} + 0.3 V$ (1.8 V min.) to 5.5 V	-	500	1000	nA

## 6 ST1PS01 block diagram

Figure 3. Block diagram

## 7 Operation description

The ST1PS01 is an ultra-low quiescent new generation buck converter. It targets a very small quiescent current consumption (typical 500 nA) and it guarantees high efficiency operation even down to few microampere loads.

It is based on a hysteretic comparator that senses the coil ripple current that is held constant in all operation modes. The device has seamless transition between PFM (pulse frequency modulation) and PWM (pulse width modulation) mode with low ripple and good load transient response.

In order to maintain constant ripple current on the selected coil, the device changes switching frequency, which also depends on input supply voltage. During PWM mode (heavy load), the device operates in continuous conduction up to 400 mA and switching frequency can reach 2 MHz maximum.

### 7.1 Power save mode

At light load the device enters automatically power save mode with total current consumption from the input power supply of 500 nA typical; during this condition most of the internal blocks are turned off in order to reach ultra-low power consumption. During this time, the load current is supported by the output capacitor.

### 7.2 Output voltage

The device allows output voltage selection without external resistor divider. A couple of standard digital inputs are used to configure the device to supply a fixed output voltage according to [Section 5](#). The  $V_{OUT}$  pin **must be connected directly and as close as possible to the inductor terminal** to obtain the best performance and get the best output voltage regulation. The output voltage can be dynamically changed to implement voltage scaling.

### 7.3 Output discharge and UVLO

The device embeds a fast output discharge circuitry active when the enable pin is held to ground ( $EN=gnd$ ) or when the input supply voltage reaches the minimum voltage level set by the UVLO protection circuit (undervoltage lock-out protection circuit). The UVLO rising threshold at 1.63 V (typ.) guarantees a proper device supply voltage operation.

### 7.4 Soft-start and current limitation

The device embeds a fixed soft-start circuit active during a limited time period (few ms). This feature allows the inrush current to be minimized from the power supply in case of weak source. During this period internal circuit reduces to 280 mA the typical switch current limit.

The ST1PS01 embeds also a current limit on high-side MOSFET to protect the device against overload or short-circuit on the output, during normal operation conditions. When the device enters 100% duty cycle operation condition and an overload (or short-circuit) occurs, the output voltage is set in shutdown in order to limit the power dissipation. To restart the device operation, a LOW to HIGH cycle on EN pin is necessary.

### 7.5 100% duty cycle operation

The device enters 100% duty cycle operation if the input voltage comes close to the selected output voltage. During this mode, the regulator is turned off and output pin is directly connected to the input pin through the high-side MOSFET. The output voltage follows the input level minus the voltage drop across the internal MOSFET and the inductor. Once the input voltage exceeds the 100% duty cycle leave threshold, the device restarts to switch and regulates the select output voltage again.

### 7.6 Power Good flag

The Power Good comparator monitors the selected  $V_{OUT}$  voltage. The Power Good open drain output is in high impedance when the  $V_{OUT}$  reaches the correct voltage level while it switches to low level when  $V_{OUT}$  falls below the normal voltage level.
