**MUSIC POWER** is the maximal power which the amplifier is capable of producing across the rated load resistance (regardless of non linearity) 1 sec after the application of a sinusoidal input signal of frequency 1KHz.

**MUTE STAND-BY FUNCTION**

The pin 5 (MUTE/STAND-BY) controls the amplifier status by two different thresholds, referred to +Vs.

- When  $V_{pin5}$  higher than  $+Vs - 2.5V$  the amplifier is in Stand-by mode and the final stage generators are off

- when  $V_{pin5}$  is between  $+Vs - 2.5V$  and  $+Vs - 6V$  the final stage current generators are switched on and the amplifier is in mute mode
- when  $V_{pin5}$  is lower than  $+Vs - 6V$  the amplifier is play mode.

**BRIDGE APPLICATION**

Another application suggestion concerns the BRIDGE configuration, where the two power amplifiers are connected as shown by the schematic diagram of figure. 18.

This application shows, however, some operative limits due to dissipation and current capability of the output stage. For this reason, we recommend to use the TDA7265 in bridge with the supply voltage equal/lower than  $\pm 16V$  when the load is  $8\Omega$ ; with higher loads (i.e.  $16\Omega$ ), the amplifier can work correctly in the whole supply voltage range.

The detected characteristics of T.H.D. vs  $P_{out}$  and Frequency Response are shown in fig.19 and fig.20.

With  $R_L=8\Omega$ ,  $V_s=\pm 16V$  the maximum output power obtainable is 50W at T.D.H.=10%.

The quiescent current remains unchanged with respect to the stereo configuration ( $\sim 80mA$  as typical at  $V_s=\pm 16V$ ).

The last point to take into consideration concerns the short-circuit protection. As for the stereo application, the TDA7265 is fully protected against any kind of short-circuit ( between Out/Gnd, Out/+Vs and Out/-Vs).
