TSYS02D
PERIPHERAL MODULE
Digital Temperature Sensor

General Description

The TSYS02D peripheral module provides the necessary hardware to interface the TSYS02D digital temperature sensor to any system that utilizes Pmod compatible expansion ports configurable for I^{2}C communication. The TSYS02D sensor is a self-contained temperature sensor that is fully calibrated during manufacture. The sensor can operate from 1.5V to 3.6V. The TSYS02D has a low power stand-by mode for power-sensitive applications.

Specifications

- Measures temperature from -40°C to 125°C
- I^{2}C communication
- Fully calibrated
- Fast response time
- Very low power consumption

Features

- 12-pin Pmod compatible connector
- I^{2}C interface
- Secondary 12-pin connector allows daisy chain
- FPGA fabric available for download
- µC C code available for download
- 24/16 bit resolution for temperature
- Parameters stored on chip

TE connectivity

Performance

- -5°C to 50°C accuracy: 0.2°C

- -20°C to 100°C accuracy: 0.5°C

- -40°C to 125°C accuracy:1°C

- Very low power consumption

- Operates from 1.5V to 3.6V

- Time constant –4 second typical

- Conversion time – 43 mS typical

Schematic

Connector Pin Assignments (I^2C Communications)

System Plug (Table 1)

Connector J1		
Pin No.	**Signal**	**Description**
1	N/C	Not Connected
2	N/C	Not Connected
3	SCL	I^2C Serial Clock
4	SDA	I^2C Serial Data
5	GND	Ground
6	Vdd	Power Supply
7	N/C	Not Connected
8	N/C	Not Connected
9	SCL	I^2C Serial Clock
10	SDA	I^2C Serial Data
11	GND	Ground
12	Vdd	Power Supply

Expansion Socket (Table 2)

Connector J2		
Pin No.	**Signal**	**Description**
1	N/C	Not Connected
2	N/C	Not Connected
3	SCL	I^2C Serial Clock
4	SDA	I^2C Serial Data
5	GND	Ground
6	Vdd	Power Supply
7	N/C	Not Connected
8	N/C	Not Connected
9	N/C	Not Connected
10	N/C	Not Connected
11	N/C	Not Connected
12	N/C	Not Connected

Dimensions(mm)

0.8"(20.3mm)

1.1"(27.9mm)

1.55"(39.4mm)

Digital Temperature Sensor

Detailed Description

I^{2}C Interface

The peripheral module can interface to the host in one of two ways. It can plug directly into a Pmod-compatible port (configured for I^{2}C) through connector J1, or in this case, other I^{2}C boards can attach to the same I^{2}C bus through connector J2.

I^{2}C Interface (Daisy Chaining Modules)

Alternatively, the peripheral module can connect to other I^{2}C-based Pmod modules through the expansion J2 connector. Connector J1 provides connection of the module to the Pmod host. The pin assignments and functions adhere to the Pmod standard as shown in Table 1. The J2 connector allows the module to be connected through a daisy-chain from another I^{2}C module and/or provide I^{2}C and power connections to other I^{2}C modules on the same bus. See Table 2.

External Control Signals

The IC operates as an I^{2}C slave using the standard 2 wire I^{2}C connection scheme. The IC is controlled either by the host (through the Pmod connector). In cases where one or more of the SCL and SDA signals are driven from an external source, resistors R1, R2 provide pull-up. However, this also increases the apparent load to the external driving source. If the external source is *in*capable of driving these loads, they should be removed.

Reference Material
