带有集成场效应晶体管 (FET) 的 3.1V 至 5.5V 输入，3A 输出，同步，降压稳压器

查询样品: TPS51312

特性

- **D-CAP2™** 模式支持快速瞬态响应
- 无需外部补偿
- 输入电压 **VIN** 范围：**3.1V** 至 **5.5V**
- 偏置电压 **VCC** 范围：**3.1V** 至 **5.5V**
- 输出电压范围：**0.6V** 至 **3.3V**
- **0.6V**，**1%** 电压基准精度
- 固定电压伺服器软启动功能
- 自动跳跃， **Eco-mode™** 用于在轻负载时实现高效率
- 开关频率：**900kHz**
- 欠压闭锁 **(UVLO)**，欠压保护 **(UVP)**，过热保护 **(OTP)** 和过压保护 **(OVP)** 电源正常输出
- 逐周期电流限制，锁存过流保护 **(OCP)**
- 耐热增强型 **3mm x 3mm**，**10** 引脚小外形尺寸无引线 **(SON) (DRC)** 封装

应用范围

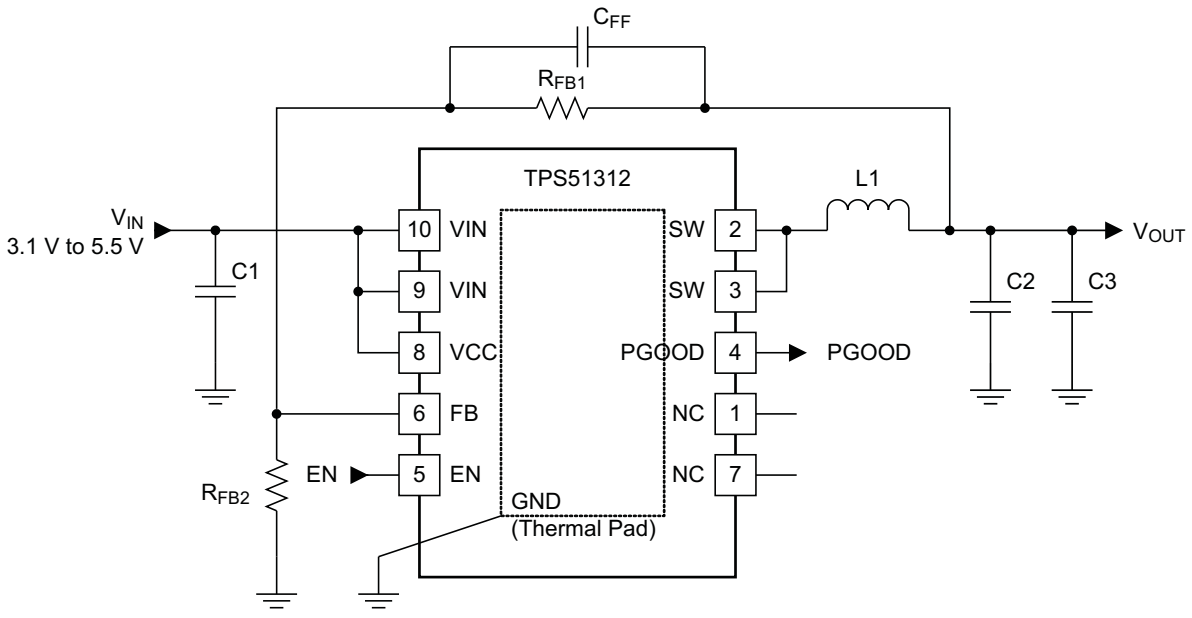
- 电池供电类设备
- 笔记本电脑

说明

TPS51312 是一款高效、同步、降压 DC/DC 转换器。它在输出电压范围为 0.6V 至 3.3V 时的输出电流为 3A（最大值）。D-CAP2 适应启动时间控制可在使用全陶瓷输出电容器设计时实现小封装尺寸并提供低外部组件数量。 此器件还特有轻负载条件下的自动跳跃功能、预偏置启动和内部固定软启动时间。 当器件被禁用时，输出电容器通过内部电阻器放电。

TPS51312 采用 3mm × 3mm，10 引脚 DRC 封装（符合 RoHs 绿色环保标准且无铅），额定温度范围为 -40°C 至 85°C。

简化的应用



This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

ORDERING INFORMATION(1)

T_A	PACKAGE	ORDERABLE DEVICE NUMBER	PINS	OUTPUT SUPPLY	MINIMUM QUANTITY	ECO PLAN
–40°C to 85°C	Plastic SON (DRC)	TPS51312DRCR	10	Tape and reel	3000	Green (RoHS and no Pb/Br)

APPLICATION INFORMATION

Functional Overview

TPS51312 is a D-CAP2 mode adaptive on time converter with internal integrator. Monolithically integrate high side and low side FET supports output current to a maximum of 3-ADC. The converter automatically runs in discontinuous conduction mode to optimize light load efficiency. A switching frequency of 900 kHz enables optimization of the power train for the cost, size and efficiency performance of the design.

PWM Operation

The PWM operation is comprised of three separate loops, A, B and C as shown in Figure 9.

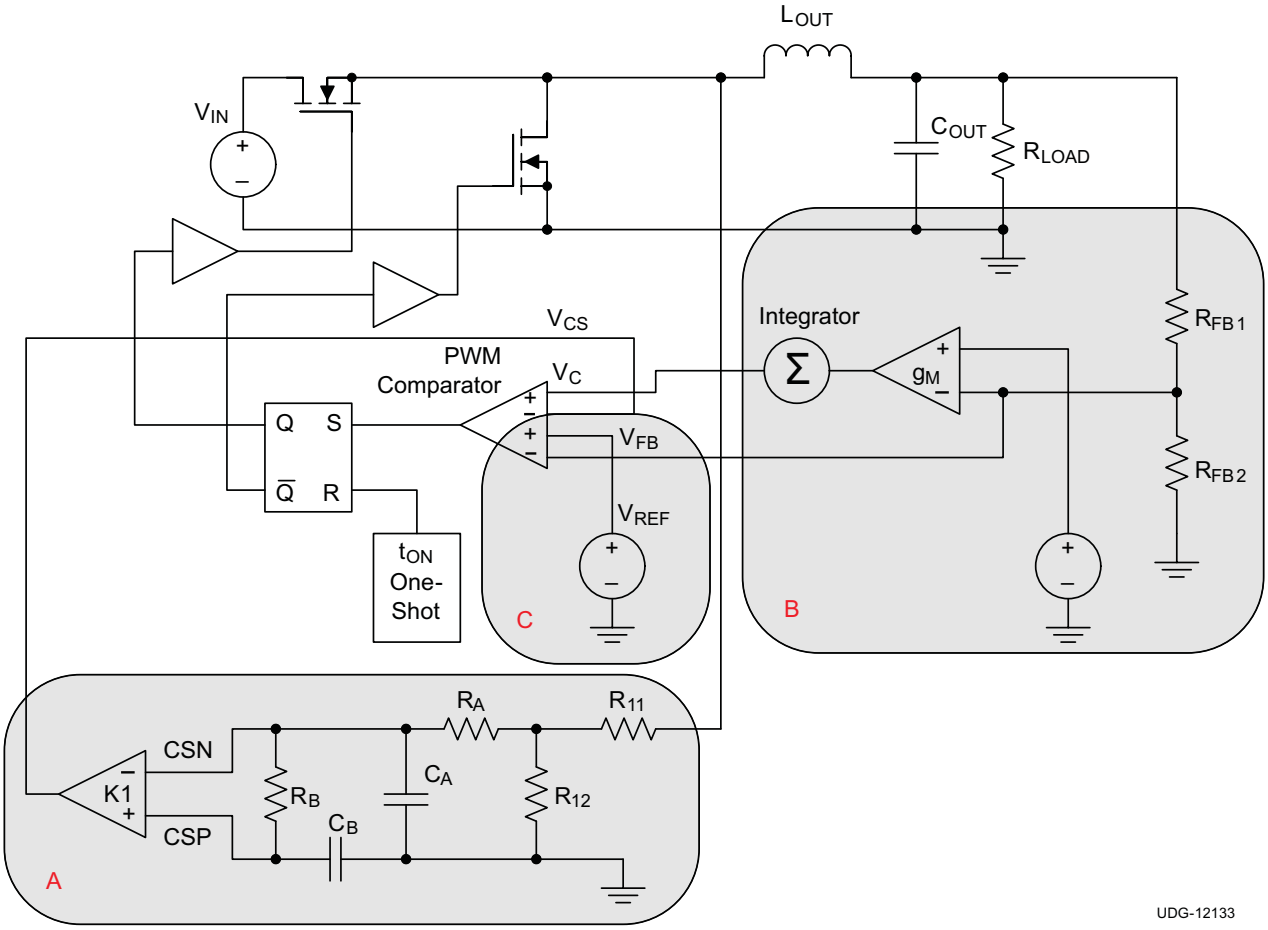

Figure 9. ¾PWM Operation

Internal Current Loop (A)

Loop A is the internal current loop. The current information is sampled, divided and averaged at the SW node. The RC time constant and the gain of the current sense amplifier is chosen to cover the wide range of power stage design intended for this application.

Internal Voltage Loop (B)

Loop B is the internal voltage loop. The feedback voltage information is compared to the voltage reference at the input of the g_M amplifier, the internal integrator is designed to provide a zero at the double pole location to boost phase margin at the desired crossover frequency.

Fast Feedforward Loop (C)

Loop C is the additional loop that acts a direct fast feedforward loop to enhance the transient response.

In steady state operation as shown in Figure 10, the on time is initiated by the interaction of the three loops mentioned above. When the (V_C– V_{CS}) is rising above threshold defined by (V_{FB} – V_{REF}), the PWM comparator issues the on time pulse after the propagation delay. The demand of on time occurs when the artificial current has reached the valley point. The load regulation is maintained by the integrator provided by the g_M amplifier and integrator.

In transient operation as shown in Figure 11, the benefit of this topology is becoming evident. In an all MLCC output configuration, especially when the output capacitance is low, when the load step is applied, the output voltage is immediately discharged to try to keep the load demand. The immediate reflection of the load demand is instantly reflected in the FB voltage. The (V_{FB} – V_{REF}) is thus served as a termination voltage level for the (V_C – V_{CS}), thus modulating the initiation of the on time. The transient response can be improved further by amplifying the difference between V_{FB} and the V_{REF} reference.

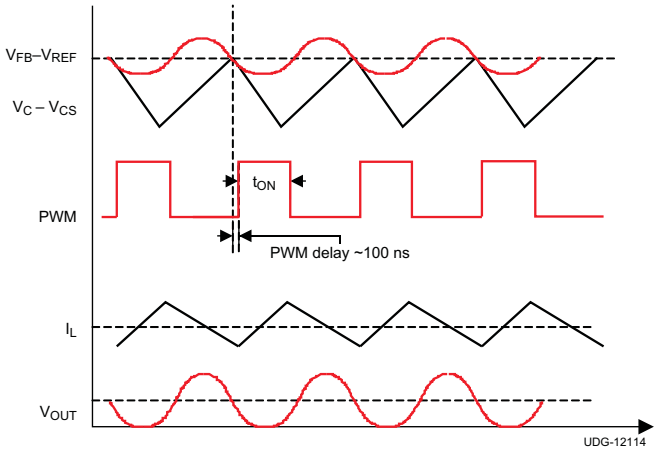

Figure 10. Steady-State Operation

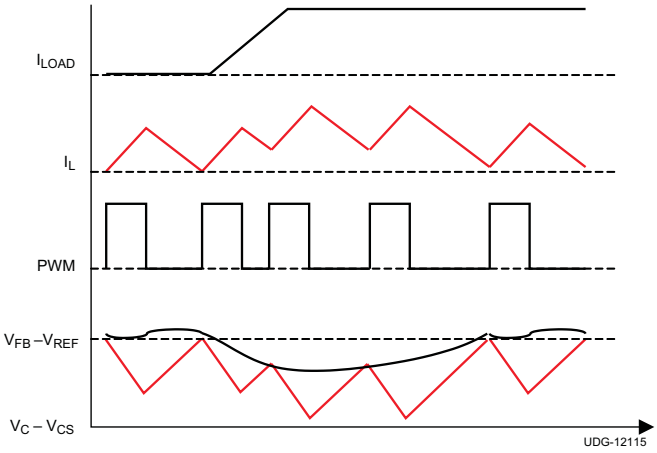

Figure 11. Transient Operation

PWM Frequency

The TPS51312 operates at a switching frequency of 900 kHz.

Light Load Power Saving Features

The TPS51312 offers an automatic pulse-skipping feature to provide excellent efficiency over the entire load range. The converter senses the current during low side FET on and prevents negative current flow by turning off the low side FET. This saves power by eliminating re-circulation of the inductor current. When the bottom FET is turned off, the converter enters discontinuous mode, and the switching frequency decreases, reducing switching loss.

Power Sequences

TPS51312 initiates the soft-start process when the EN, VIN and VCC pins are ready. The soft-start time 300 µs when the reference voltage is between 0 V and 0.6 V (V_{REF}). The actual voltage ramp up time is the same as that of the V_{REF} start-up time, which is 300 µs.

Power Good Signal

The TPS51312 has one open-drain power good (PGOOD) pin. During initial startup, there is a 1.3-ms power good high propagation delay after EN goes high. The PGOOD de-asserts when the EN is pulled low or an undervoltage condition on VCC or VIN or any other faults (such as V_{OUT}, UVP, OCP, OVP) that require latch off action is detected.

Protection Features

The TPS51312 offers many features to protect the converter power chain as well as the system electronics.

Input Undervoltage Protection on V_{CC} and V_{IN} (UVLO)

The TPS51312 continuously monitor the voltage on the V_{CC} and V_{IN} to ensure the voltage level is high enough to bias the converter properly and to provide sufficient gate drive potential to maintain high efficiency for the converter. The converter starts with V_{CC} and V_{IN} approximately 2.95 V and has a nominal of 250 mV of hysteresis, assuming EN is above the logic threshold level. If the UVLO level is reached for either V_{CC} or V_{IN}, the converter transitions the SW node into a tri-state and remains off until the device is reset by both V_{CC} and V_{IN} reaches 2.95 V (nominal). The PGOOD is deasserted when UVLO is detected and remains low until the device is reset.

Output Overvoltage Protection (OVP)

The TPS51312 has OVP protection circuit. An OVP event is detected when the FB voltage is approximately 130% x 0.6VREF. In this case, the converter de-asserts the PGOOD signal and performs the overvoltage protection function. The converter latches off both high-side and low-side FET and remains in this state after a delay of 1.9 µs (typ) until the device is reset by EN, or V_{CC} or V_{IN}.

Output Undervoltage Protection (UVP)

Output undervoltage protection works in conjunction with the current protection described in the Overcurrent and Current Limit Protection section. If the FB voltage drops below 50% x 0.6 V_{REF}, after a delay of 2.4 µs (typ), the converter latches off. Undervoltage protection can be reset by EN, V_{CC} or V_{IN}.

Overcurrent and Current Limit Protection

The TPS51312 provides an overcurrent protection function. The nominal OCP is 4.8-A DC. When the current limit is exceeded for consecutive 9 cycles, the converter latches off and remains latched off until it is reset by EN, V_{CC} or V_{IN}.

The TPS51312 also provides current limit protection function. If the sense current is above the OCL setting, the converter delays the next on pulse until the current level drops below the OCL limit. Current limiting occurs on a pulse-by-pulse basis. During a fast or very fast overcurrent event, the output voltage tends to droop until the UVP limit is reached. Then the converter de-asserts the PGOOD signal, and latches off after a typical delay time of 2.4 µs. The converter remains in this state until the device is reset by EN, V_{CC} or V_{IN}.

Thermal Protection

The TPS51312 has an internal temperature sensor. When the die temperature reaches a nominal of 145°C, the device shuts down until the temperature cools by approximately 20°C. Then the converter restarts. The thermal shutdown is an non-latched behavior.

REFERENCE DESIGN

Application Schematic

Figure 12 shows the application schematic..

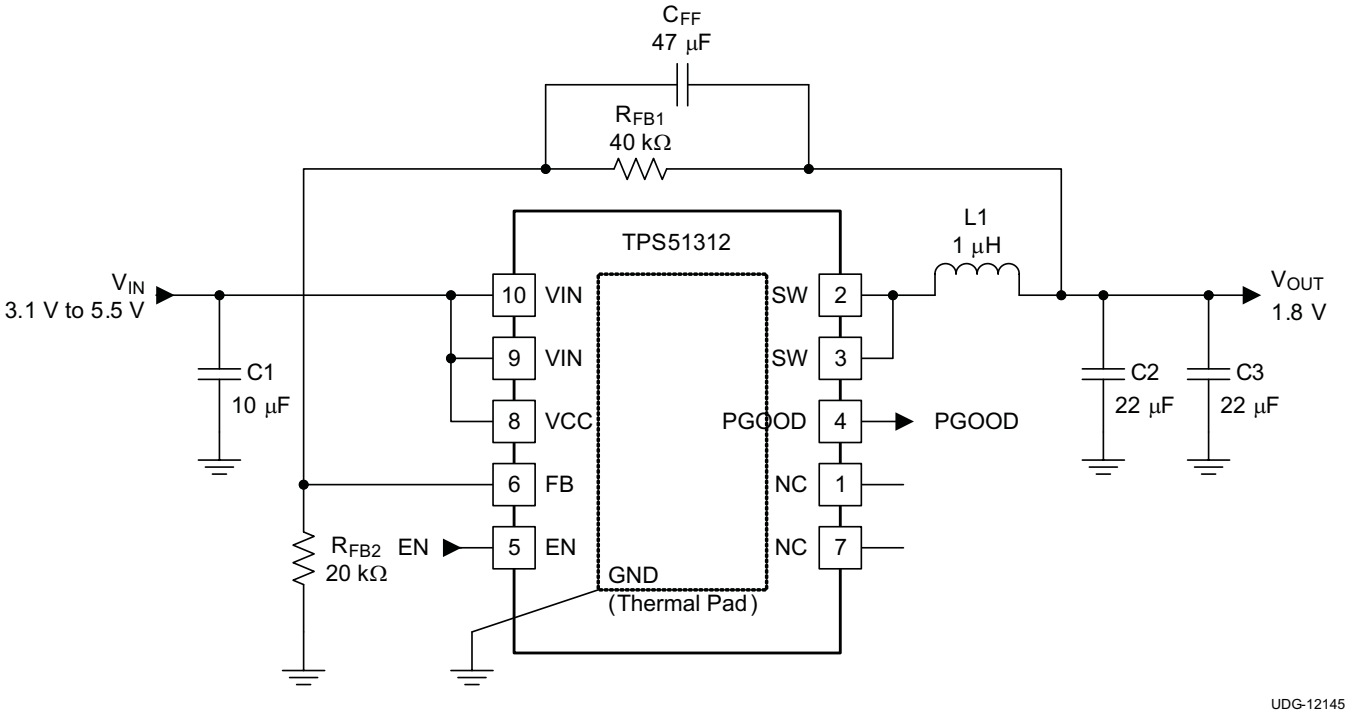

Figure 12. Reference Design Schematic

Table 1. Reference Design List of Materials

FUNCTION	MANUFACTURER	PART NUMBER
Output Inductor	Vishay	IHLP-2020BZ-01
Ceramic Output Capacitors	Panasonic	ECJ2FB0J226M
	Murata	GRM21BR60J226ME39L

Design Procedure

Step One. Determine the specifications.

- V_{OUT} = 1.8 V
- $I_{CC(max)}$ = 3 A
- di/dt = 2.5 A/µs

Step Two. Determine the system parameters.

The input voltage range and operating frequency are of primary interest. For example,

- $V_{IN} = V_{CC}$ = 5 V
- f_{SW} = 900 kHz.

Step Three. Set the output voltage.

Use Equation 1 to determine the output voltage.

$$V_{OUT} = V_{REF} \times \left(\frac{R_{FB1} + R_{FB2}}{R_{FB2}} \right) \quad (1)$$

The output voltage is determined by VREF (0.6 V) and the resistor dividers (R_{FB1} and R_{FB2}). The output voltage is regulated to the FB pin. For the current reference design of 1.8 V, select 40 kΩ as the value for R_{FB1} and 20 kΩ as the value of R_{FB2} (see Figure 12). As a recommendation, choose a value of less 50 kΩ both resisters. Place a 47-pF, feedford capacitor in parallel with R_{FB1} to help reduce the output voltage ripple during the transition from DCM to CCM.

Step Four. Determine inductor value and choose inductor.

Smaller inductance yields better transient performance but the consequence is higher ripple and lower efficiency. Higher values have the opposite characteristics. It is common practice to limit the ripple current to 25% to 50% of the maximum current. In this case, use 40%:

$$I_{P-P} = 3\,A \times 0.4 = 1.2\,A$$

where

- f_{SW} = 900 kHz
- V_{IN} = 5 V
- V_{OUT} = 1.8 V

(2)

$$L = \frac{V \times dT}{I_{P-P}} = \left(\frac{(V_{IN} - V_{OUT})}{I_{P-P}} \right) \times \left(\frac{V_{OUT}}{(f_{SW} \times V_{IN})} \right) = 1\mu H \quad (3)$$

For this application, choose a 1-µH, 18.9-mΩ inductor from Vishay part number IHLP-2020BZ-01.

Step Five. Determine the output capacitance.

To determine C_{OUT} based on transient and stability requirement, first calculate the minimum output capacitance for a given transient.

Equation 4 and Equation 5 calculate the minimum output capacitance for meeting the transient requirement.

$$C_{OUT(min\_under)} = \frac{L \times \Delta I_{LOAD(max)}^2 \times \left(\frac{V_{VOUT} \times t_{SW}}{V_{IN(min)}} + t_{MIN(off)} \right)}{2 \times \Delta V_{LOAD(insert)} \times \left(\left(\frac{V_{IN(min)} - V_{VOUT}}{V_{IN(min)}} \right) \times t_{SW} - t_{MIN(off)} \right) \times V_{VOUT}} \quad (4)$$

$$C_{OUT(min\_over)} = \frac{L_{OUT} \times \left(\Delta I_{LOAD(max)} \right)^2}{2 \times \Delta V_{LOAD(release)} \times V_{VOUT}} \quad (5)$$

Table 2. Choosing Output Inductors and Output Capacitors

TEMPERATURE	OUTPUT VOLTAGE V_{OUT} (V)	INDUCTANCE L_{OUT} (µH)	OUTPUT CAPACITORS		FAST FEEDFORWARD CAPACITOR C_{FF} (pF)
			NUMBER	VALUE (µF)	
–10°C ≤ T_A ≤ 85°C	1.5	1	1	22	47
	1.8	1	1		
	3.3	2.2	2		
–40°C ≤ T_A ≤ 85°C	1.5	1	2		
	1.8	1	2		
	3.3	2.2	3		

Step Six. Establishing the internal compensation loop.

The TPS51312 is designed with an internal compensation loop. The internal integrator zero location is approximately 60 kHz. During the time that the power stage double pole frequency contributed by the L_{OUT} and C_{OUT} is less than or equal to that of the zero location, the converter is stable with sufficient margin.

Step Seven. Select decoupling and peripheral components.

For TPS51312 peripheral capacitors use the following minimum value of ceramic capacitance, X5R or better temperature coefficient is recommended. Tighter tolerances and higher voltage ratings are always appropriate.

V_{CC} and V_{IN} decoupling ≥ 2 × 10 µF, 6.3 V

Pull up resistor on PGOOD = 100 kΩ

Layout Considerations

Good layout is essential for stable power supply operation. Follow these guidelines for an efficient PCB layout.

- Place V_{IN}, V_{CC} decoupling capacitors as close to the device as possible.
- Use wide traces for the VIN, SW and GND pins. These nodes carry high current and also serve as heat sinks.
- Place FB and voltage setting dividers as close to the device as possible.
- Place an R-C network from SW to GND to help to reduce the voltage spikes on the SW pin.

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead finish/ Ball material (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
TPS51312DRCR	ACTIVE	VSON	DRC	10	3000	RoHS & Green	NIPDAU	Level-1-260C-UNLIM	-40 to 85	S51312	Samples
TPS51312DRCT	ACTIVE	VSON	DRC	10	250	RoHS & Green	NIPDAU	Level-1-260C-UNLIM	-40 to 85	S51312	Samples

(1) The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".
RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.
Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
