

## ISO7142CC 4242 V<sub>PK</sub> 小型封装低功耗四通道数字隔离器

### 1 特性

- 最大信号传输速率：50Mbps（5V 电源供电）
- 具有集成噪声滤波器的稳健设计
- 低功耗，每通道 I<sub>CC</sub> 典型值（3.3V 电源）：
  - 1Mbps 时为 1.3mA，25Mbps 时为 2.5mA
- 宽温度范围：-55°C 至 +125°C
- 典型值为 50kV/μs 的瞬态抗扰度
- 使用 SiO<sub>2</sub> 绝缘隔栅实现长使用寿命
- 可由 2.7V、3.3V 和 5V 电源供电
- 2.7V 和 5V 电平转换
- 小型四分之一英寸小外形封装 (QSOP)-16 封装
- 安全及管理批准
  - 符合 UL 1577 标准且长达 1 分钟的 2500 V<sub>RMS</sub> 隔离
  - 符合 DIN V VDE V 0884-10 (VDE V 0884-10):2006-12 标准的 4242 V<sub>PK</sub> 隔离
  - CSA 组件验收通知 5A, IEC 60950-1 和 IEC 61010-1 终端设备标准
  - 符合 GB4943.1-2011 的 CQC 认证

### 2 应用

- 通用隔离
- 工业自动化
- 电机控制
- 太阳能逆变器

### 3 说明

ISO7142CC 器件可提供符合 UL 1577 标准的长达 1 分钟且高达 2500 V<sub>RMS</sub> 的电流隔离，以及符合 VDE V 0884-10 标准的 4242 V<sub>PK</sub> 隔离。

ISO7142CC 是一款四通道隔离器，此隔离器具有两个正向和两个反向通道。此器件在由 5V 电源供电时的最大数据传输速率为 50Mbps，而在由 3.3V 或 2.7V 电源供电时的最大数据传输速率为 40Mbps。

ISO7142CC 器件的输入端集成有滤波器，适用于易受噪声干扰的应用。

每个隔离通道都有一个由二氧化硅 (SiO<sub>2</sub>) 绝缘隔栅分开的逻辑输入和输出缓冲器。与隔离式电源一起使用，这个器件可防止数据总线或者其它电路上的噪音电流进入本地接地和干扰或损坏敏感电路。该器件具有晶体管逻辑电路 (TTL) 输入阈值，并且可由 2.7V、3.3V 和 5V 电压供电运行。

## 6 Specifications

### 6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)<sup>(1)</sup>

		MIN	MAX	UNIT
Supply voltage <sup>(2)</sup>	$V_{CC1}, V_{CC2}$	-0.5	6	V
Voltage	INx, OUTx, ENx	-0.5	$V_{CC} + 0.5^{(3)}$	V
$I_O$	Output current	-15	15	mA
$T_J$	Maximum junction temperature		150	°C
$T_{stg}$	Storage temperature	-65	150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions* is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) All voltage values except differential I/O bus voltages are with respect to the local ground terminal (GND1 or GND2) and are peak voltage values.
- (3) Maximum voltage must not exceed 6 V.

### 6.2 ESD Ratings

		VALUE	UNIT
$V_{(ESD)}$ Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001 <sup>(1)</sup>	±4000	V
	Charged-device model (CDM), per JEDEC specification JESD22-C101 <sup>(2)</sup>	±1500	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

### 6.3 Recommended Operating Conditions

		MIN	NOM	MAX	UNIT
$V_{CC1}, V_{CC2}$	Supply voltage	2.7		5.5	V
$I_{OH}$	High-level output current	$V_{CC} \geq 3\text{ V}$		-4	mA
		$V_{CC} < 3\text{ V}$		-2	
$I_{OL}$	Low-level output current			4	mA
$V_{IH}$	High-level input voltage	2		5.5	V
$V_{IL}$	Low-level input voltage	0		0.8	V
$t_{ui}$	Input pulse duration	$V_{CC} \geq 4.5\text{ V}$		20	ns
		$V_{CC} < 4.5\text{ V}$		25	
$1 / t_{ui}$	Signaling rate	$V_{CC} \geq 4.5\text{ V}$		0	Mbps
		$V_{CC} < 4.5\text{ V}$		0	
$T_J$	Junction temperature			136	°C
$T_A$	Ambient temperature	-55	25	125	°C

## 8 Detailed Description

### 8.1 Overview

The isolator in [Figure 12](#) is based on a capacitive isolation barrier technique. The I/O channel of the device consists of two internal data channels, a high-frequency channel (HF) with a bandwidth from 100 kbps up to 50 Mbps, and a low-frequency channel (LF) covering the range from 100 kbps down to DC. In principle, a single-ended input signal entering the HF-channel is split into a differential signal through the inverter gate at the input. The following capacitor-resistor networks differentiate the signal into transients, which then are converted into differential pulses by two comparators. The comparator outputs drive a NOR-gate flip-flop whose output feeds an output multiplexer. A decision logic (DCL) at the driving output of the flip-flop measures the durations between signal transients. If the duration between two consecutive transients exceeds a certain time limit, (as in the case of a low-frequency signal), the DCL forces the output-multiplexer to switch from the high- to the low-frequency channel.

Because low-frequency input signals require the internal capacitors to assume prohibitively large values, these signals are pulse-width modulated (PWM) with the carrier frequency of an internal oscillator, thus creating a sufficiently high frequency signal, capable of passing the capacitive barrier. As the input is modulated, a low-pass filter (LPF) is needed to remove the high-frequency carrier from the actual data before passing it on to the output multiplexer.

#### NOTE

Creepage and clearance requirements should be applied according to the specific equipment isolation standards of an application. Care should be taken to maintain the creepage and clearance distance of a board design to ensure that the mounting pads of the isolator on the printed circuit board do not reduce this distance.

Creepage and clearance on a printed circuit board become equal in certain cases. Techniques such as inserting grooves and/or ribs on a printed circuit board are used to help increase these specifications.

### 8.3.3 Safety Limiting Values

Safety limiting intends to minimize potential damage to the isolation barrier upon failure of input or output circuitry. A failure of the IO can allow low resistance to ground or the supply and, without current limiting, dissipate sufficient power to overheat the die and damage the isolation barrier, potentially leading to secondary system failures.

PARAMETER	TEST CONDITIONS			UNIT
	MIN	TYP	MAX	
I <sub>S</sub> Safety input, output, or supply current	DBQ-16	θ <sub>JA</sub> = 104.5°C/W, V <sub>I</sub> = 5.5 V, T <sub>J</sub> = 150°C, T <sub>A</sub> = 25°C		217
		θ <sub>JA</sub> = 104.5°C/W, V <sub>I</sub> = 3.6 V, T <sub>J</sub> = 150°C, T <sub>A</sub> = 25°C		332
		θ <sub>JA</sub> = 104.5°C/W, V <sub>I</sub> = 2.7 V, T <sub>J</sub> = 150°C, T <sub>A</sub> = 25°C		443
T <sub>S</sub> Maximum safety temperature			150	°C

The safety-limiting constraint is the absolute-maximum junction temperature specified in the [Absolute Maximum Ratings](#) table. The power dissipation and junction-to-air thermal impedance of the device installed in the application hardware determines the junction temperature. The assumed junction-to-air thermal resistance in the [Thermal Information](#) table is that of a device installed on a high-K test board for leaded surface-mount packages. The power is the recommended maximum input voltage times the current. The junction temperature is then the ambient temperature plus the power times the junction-to-air thermal resistance.

## 9 Application and Implementation

### NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

### 9.1 Application Information

The ISO7142CC device uses single-ended TTL-logic switching technology. The supply voltage range is from 2.7 V to 5.5 V for both supplies,  $V_{CC1}$  and  $V_{CC2}$ . When designing with digital isolators, keep in mind that because of the single-ended design structure the single-ended design structure, digital isolators do not conform to any specific interface standard and are only intended for isolating single-ended CMOS or TTL digital signal lines. The isolator is typically placed between the data controller (that is,  $\mu C$  or UART), and a data converter or a line transceiver, regardless of the interface type or standard.

### 9.2 Typical Application

Figure 15 shows the typical isolated RS-232 interface implementation.

Figure 15. Typical Isolated RS-232 Application Circuit for ISO7142

#### 9.2.1 Design Requirements

Unlike optocouplers, which require external components to improve performance, provide bias, or limit current, the ISO7142CC device only requires two external bypass capacitors to operate.

## Typical Application (continued)

### 9.2.2 Detailed Design Procedure

Figure 16 shows the hookup of a typical ISO7142CC circuit. The only external components are two bypass capacitors.

## Typical Application (continued)

Figure 19. Typical Eye Diagram at 50 Mbps, PRBS  $2^{16} - 1$ , 5-V Operation

## 10 Power Supply Recommendations

To help ensure reliable operation supply voltages, a 0.1- $\mu$ F bypass capacitor is recommended at the input and output supply pins ( $V_{CC1}$  and  $V_{CC2}$ ). The capacitors should be placed as close to the supply pins as possible. If only a single primary-side power supply is available in an application, isolated power can be generated for the secondary-side with the help of a transformer driver such as Texas Instruments' [SN6501-Q1](#). For such applications, detailed power supply design and transformer selection recommendations are available in [SN6501-Q1](#) datasheet ([SLLSEF3](#)).

## 11 Layout

### 11.1 Layout Guidelines

A minimum of four layers is required to accomplish a low EMI PCB design (see [Figure 20](#)). Layer stacking should be in the following order (top-to-bottom): high-speed signal layer, ground plane, power plane and low-frequency signal layer.

- Routing the high-speed traces on the top layer avoids the use of vias (and the introduction of their inductances) and allows for clean interconnects between the isolator and the transmitter and receiver circuits of the data link.
- Placing a solid ground plane next to the high-speed signal layer establishes controlled impedance for transmission line interconnects and provides an excellent low-inductance path for the return current flow.
- Placing the power plane next to the ground plane creates additional high-frequency bypass capacitance of approximately 100 pF/in<sup>2</sup>.
- Routing the slower speed control signals on the bottom layer allows for greater flexibility as these signal links usually have margin to tolerate discontinuities such as vias.

If an additional supply voltage plane or signal layer is needed, add a second power and ground plane system to the stack to keep it symmetrical. This makes the stack mechanically stable and prevents it from warping. Also the power and ground plane of each power system can be placed closer together, thus increasing the high-frequency bypass capacitance significantly.

For detailed layout recommendations, see the application note, *Digital Isolator Design Guide*, [SLLA284](#).

## Layout Guidelines (continued)

### 11.1.1 PCB Material

For digital circuit boards operating below 150 Mbps, (or rise and fall times higher than 1 ns), and trace lengths of up to 10 inches, use standard FR-4 UL 94 V-0 printed circuit board. This PCB is preferred over cheaper alternatives because of lower dielectric losses at high frequencies, less moisture absorption, greater strength and stiffness, and self-extinguishing flammability-characteristics.

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

**RoHS Exempt:** TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

**Green:** TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
