

# DRV8872具有故障报告功能的 3.6A 刷式直流电机驱动器 (PWM 控制)

## 1 特性

- H 桥电机驱动器
  - 驱动一个直流电机、一个步进电机的绕组或其他负载
- 6.5V 至 45V 宽工作电压范围
- 565mΩ (典型值)  $R_{DS(on)}$  (HS + LS)
- 3.6A 峰值电流驱动能力
- 脉宽调制 (PWM) 控制接口
- 集成电流调节功能
- 低功耗休眠模式
- 故障状态输出引脚
- 小型封装尺寸
  - 8 引脚 HSOP 封装, 带有 PowerPAD™
  - 4.9mm x 6mm
- 集成保护功能
  - VM 欠压闭锁 (UVLO)
  - 过流保护 (OCP)
  - 热关断 (TSD)
  - 故障报告 (nFAULT)
  - 自动故障恢复

## 2 应用范围

- 打印机
- 电器
- 工业设备
- 其他机电应用

## 3 说明

DRV8872 器件是一款刷式直流 (BDC) 电机驱动器, 适用于打印机、电器、工业设备和其他小型机器。两个逻辑输入控制 H 桥驱动器, 该驱动器由四个 N 沟道金属氧化物半导体场效应晶体管 (MOSFET) 组成, 能够以高达 3.6A 的峰值电流执行双向电机控制。利用电流衰减模式, 可通过对输入进行脉宽调制 (PWM) 来控制电机转速。如果将两个输入均置为低电平, 则电机驱动器将进入低功耗休眠模式。

DRV8872 器件具备集成电流调节功能。该功能基于内部基准电压以及 ISEN 引脚电压 (与流经外部感测电阻的电机电流成正比)。该器件能够将电流限制在某一已知水平, 这可显著降低系统功耗要求, 并且无需大容量电容来维持稳定电压, 尤其是在电机启动和停转时。

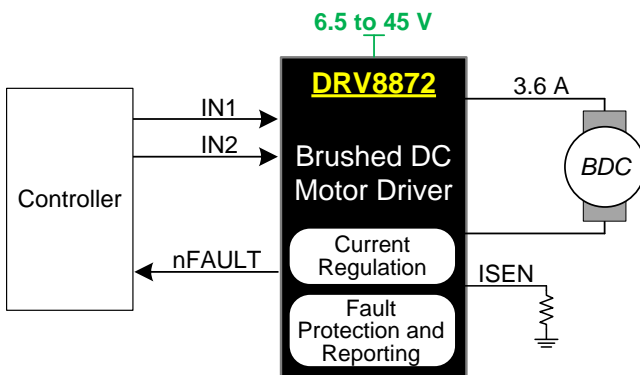

该器件针对故障和短路问题提供了全面保护, 包括欠压锁定 (UVLO)、过流保护 (OCP) 和热关断 (TSD)。通过将 nFAULT 输出拉为低电平来报告故障。故障排除后, 器件自动恢复正常状态。

## 5 Pin Configuration and Functions

### Pin Functions

PIN		TYPE	DESCRIPTION	
NAME	NO.			
GND	1	PWR	Logic ground	Connect to board ground.
IN1	3	I	Logic inputs	Controls the H-bridge output. Has internal pulldowns. (See <a href="#">表 1.</a> )
IN2	2			
ISEN	7	PWR	High-current ground path	If using current regulation, connect ISEN to a resistor (low-value, high-power-rating) to ground. If not using current regulation, connect ISEN directly to ground.
nFAULT	4	OD	Fault status (open-drain)	Low-level indicates UVLO, TSD, or OCP fault. Connect to a pullup resistor.
OUT1	6	O	H-bridge outputs	Connect directly to the motor, or other inductive load.
OUT2	8			
VM	5	PWR	6.5-V to 45-V power supply	Connect a 0.1- $\mu$ F bypass capacitor to ground, as well as sufficient bulk capacitance, rated for the VM voltage.
PAD	—	—	Thermal pad	Connect to board ground. For good thermal dissipation, use large ground planes on multiple layers, and multiple nearby vias connecting those planes.

## 6 Specifications

### 6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)<sup>(1)</sup>

	MIN	MAX	UNIT
Power supply voltage (VM)	-0.3	50	V
Logic input voltage (IN1, IN2)	-0.3	7	V
Fault pin (nFAULT)	-0.3	6	V
Continuous phase node pin voltage (OUT1, OUT2)	-0.7	VM + 0.7	V
Current sense input pin voltage (ISEN) <sup>(2)</sup>	-0.5	1	V
Output current (100% duty cycle)	0	3.5	A
Operating junction temperature, T <sub>J</sub>	-40	150	°C
Storage temperature, T <sub>stg</sub>	-65	150	°C

(1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

(2) Transients of  $\pm 1$  V for less than 25 ns are acceptable

## 6.2 ESD Ratings

		VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 <sup>(1)</sup>	±6000
		Charged-device model (CDM), per JEDEC specification JESD22-C101 <sup>(2)</sup>	±750

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.

(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

## 6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
$V_M$	Power supply voltage	6.5		45	V
$V_I$	Logic input voltage (IN1, IN2)	0		5.5	V
$f_{PWM}$	Logic input PWM frequency (IN1, IN2)	0		200 <sup>(1)</sup>	kHz
$I_{peak}$	Peak output current <sup>(2)</sup>	0		3.6	A
$T_A$	Operating ambient temperature	–40		125	°C

(1) The voltages applied to the inputs should have at least 800 ns of pulse width to ensure detection. Typical devices require at least 400 ns. If the PWM frequency is 200 kHz, the usable duty cycle range is 16% to 84%

(2) Power dissipation and thermal limits must be observed

## 6.4 Thermal Information

THERMAL METRIC <sup>(1)</sup>		DRV8872	UNIT
		DDA (HSOP)	
		8 PINS	
$R_{\theta JA}$	Junction-to-ambient thermal resistance	41.1	°C/W
$R_{\theta JC(top)}$	Junction-to-case (top) thermal resistance	53.1	°C/W
$R_{\theta JB}$	Junction-to-board thermal resistance	23.1	°C/W
$\Psi_{JT}$	Junction-to-top characterization parameter	8.2	°C/W
$\Psi_{JB}$	Junction-to-board characterization parameter	23	°C/W
$R_{\theta JC(bot)}$	Junction-to-case (bottom) thermal resistance	2.7	°C/W

(1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application report.

## 6.5 Electrical Characteristics

 $T_A = 25^\circ\text{C}$ , over recommended operating conditions (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
<b>POWER SUPPLY (VM)</b>						
VM	VM operating voltage		6.5		45	V
$I_{VM}$	VM operating supply current	VM = 12 V		3	10	mA
$I_{VMSLEEP}$	VM sleep current	VM = 12 V			10	$\mu\text{A}$
$t_{ON}$	Turn-on time <sup>(1)</sup>	VM > $V_{UVLO}$ with IN1 or IN2 high		40	50	$\mu\text{s}$
<b>LOGIC-LEVEL INPUTS (IN1, IN2)</b>						
$V_{IL}$	Input logic low voltage				0.5	V
$V_{IH}$	Input logic high voltage		1.5			V
$V_{HYS}$	Input logic hysteresis			0.5		V
$I_{IL}$	Input logic low current	$V_{IN} = 0\text{ V}$	-1		1	$\mu\text{A}$
$I_{IH}$	Input logic high current	$V_{IN} = 3.3\text{ V}$		33	100	$\mu\text{A}$
$R_{PD}$	Pulldown resistance	To GND		100		k $\Omega$
$t_{PD}$	Propagation delay	INx to OUTx change (see <a href="#">图 6</a> )		0.7	1	$\mu\text{s}$
$t_{sleep}$	Time to sleep	Inputs low to sleep		1	1.5	ms
<b>MOTOR DRIVER OUTPUTS (OUT1, OUT2)</b>						
$R_{DS(ON)}$	High-side FET on resistance	VM = 24 V, I = 1 A, $f_{PWM} = 25\text{ kHz}$		307	360	m $\Omega$
$R_{DS(ON)}$	Low-side FET on resistance	VM = 24 V, I = 1 A, $f_{PWM} = 25\text{ kHz}$		258	320	m $\Omega$
$t_{DEAD}$	Output dead time			220		ns
$V_d$	Body diode forward voltage	$I_{OUT} = 1\text{ A}$		0.8	1	V
<b>CURRENT REGULATION</b>						
$V_{TRIP}$	ISEN voltage for current chopping		0.32	0.35	0.38	V
$t_{OFF}$	PWM off-time			25		$\mu\text{s}$
$t_{BLANK}$	PWM blanking time			2		$\mu\text{s}$
<b>PROTECTION CIRCUITS</b>						
$V_{UVLO}$	VM undervoltage lockout	VM falls until UVLO triggers		6.1	6.4	V
		VM rises until operation recovers		6.3	6.5	
$V_{UV,HYS}$	VM undervoltage hysteresis	Rising to falling threshold	100	180		mV
$I_{OCP}$	Overcurrent protection trip level		3.7	4.5	6.4	A
$t_{OCP}$	Overcurrent deglitch time			1.5		$\mu\text{s}$
$t_{RETRY}$	Overcurrent retry time			3		ms
$T_{SD}$	Thermal shutdown temperature		150	175		$^\circ\text{C}$
$T_{HYS}$	Thermal shutdown hysteresis			40		$^\circ\text{C}$
<b>nFAULT OPEN DRAIN OUTPUT</b>						
$V_{OL}$	Output low voltage	$I_O = 5\text{ mA}$			0.5	V
$I_{OH}$	Output high leakage current	$V_O = 3.3\text{ V}$			1	$\mu\text{A}$

(1)  $t_{ON}$  applies when the device initially powers up, and when it exits sleep mode.

### 6.6 Typical Characteristics

## 7 Detailed Description

### 7.1 Overview

The DRV8872 device is an optimized 8-pin device for driving brushed DC motors with 6.5 to 45 V and up to 3.6-A peak current. The integrated current regulation restricts motor current to a predefined maximum. Two logic inputs control the H-bridge driver, which consists of four N-channel MOSFETs that have a typical  $R_{ds(on)}$  of 565 m $\Omega$  (including one high-side and one low-side FET). A single power input, VM, serves as both device power and the motor winding bias voltage. The integrated charge pump of the device boosts VM internally and fully enhances the high-side FETs. Motor speed can be controlled with pulse-width modulation, at frequencies between 0 to 100 kHz. The device has an integrated sleep mode that is entered by bringing both inputs low. An assortment of protection features prevent the device from being damaged if a system fault occurs.

### 7.2 Functional Block Diagram

Copyright © 2016, Texas Instruments Incorporated

### 7.3 Feature Description

#### 7.3.1 Bridge Control

The DRV8872 output consists of four N-channel MOSFETs that are designed to drive high current. These MOSFETs are controlled by the two logic inputs IN1 and IN2, according to 表 1.

表 1. H-Bridge Control

IN1	IN2	OUT1	OUT2	DESCRIPTION
0	0	High-Z	High-Z	Coast; H-bridge disabled to High-Z (sleep entered after 1 ms)
0	1	L	H	Reverse (current OUT2 → OUT1)
1	0	H	L	Forward (current OUT1 → OUT2)
1	1	L	L	Brake; low-side slow decay

The inputs can be set to static voltages for 100% duty-cycle drive, or they can be pulse-width modulated (PWM) for variable motor speed. When using PWM, switching between driving and braking typically works best. For example, to drive a motor forward with 50% of its max RPM, IN1 = 1 and IN2 = 0 during the driving period, and IN1 = 1 and IN2 = 1 during the other period. Alternatively, the coast mode (IN1 = 0, IN2 = 0) for *fast current decay* is also available. The input pins can be powered before VM is applied.

图 4. H-Bridge Current Paths

#### 7.3.2 Sleep Mode

When IN1 and IN2 are both low for time  $t_{SLEEP}$  (typically 1 ms), the DRV8872 device enters a low-power sleep mode, where the outputs remain High-Z and the device uses  $I_{VMSLEEP}$  (microamps) of current. If the device is powered up while both inputs are low, sleep mode is immediately entered. After IN1 or IN2 are high for at least 5  $\mu s$ , the device is operational 50  $\mu s$  ( $t_{ON}$ ) later.

#### 7.3.3 Current Regulation

The DRV8872 device limits the output current based on the resistance of an external sense resistor on pin ISEN, according to 公式 1.

$$I_{TRIP} (A) = \frac{V_{TRIP} (V)}{R_{ISEN} (\Omega)} = \frac{0.35 (V)}{R_{ISEN} (\Omega)} \quad (1)$$

For example, if  $R_{ISEN} = 0.16 \Omega$ , the DRV8872 device limits motor current to 2.2 A no matter how much load torque is applied. For guidelines on selecting a sense resistor, see the [Sense Resistor](#) section.

When  $I_{TRIP}$  has been reached, the device enforces slow current decay by enabling both low-side FETs, and it does this for time  $t_{OFF}$  (typically 25  $\mu$ s).

图 5. Current Regulation Time Periods

After  $t_{OFF}$  has elapsed, the output is re-enabled according to the two inputs  $IN_x$ . The drive time ( $t_{DRIVE}$ ) until reaching another  $I_{TRIP}$  event heavily depends on the VM voltage, the back-EMF of the motor, and the inductance of the motor.

### 7.3.4 Dead Time

When an output changes from driving high to driving low, or driving low to driving high, dead time is automatically inserted to prevent shoot-through.  $t_{DEAD}$  is the time in the middle when the output is High-Z. If the output pin is measured during  $t_{DEAD}$ , the voltage will depend on the direction of current. If current is leaving the pin, the voltage is a diode drop below ground. If current is entering the pin, the voltage is a diode drop above VM. This diode is the body diode of the high-side or low-side FET.

图 6. Propagation Delay Time

### 7.3.5 Protection Circuits

The DRV8872 device is fully protected against VM undervoltage, overcurrent, and overtemperature events. When the device is in a protected state, nFAULT is driven low. When the fault condition is removed, nFAULT becomes a high-impedance state.

#### 7.3.5.1 VM Undervoltage Lockout (UVLO)

If at any time the voltage on the VM pin falls below the undervoltage-lockout threshold voltage, all FETs in the H-bridge are disabled. Operation resumes when VM rises above the UVLO threshold.

#### 7.3.5.2 Overcurrent Protection (OCP)

If the output current exceeds the OCP threshold  $I_{OCP}$  for longer than  $t_{OCP}$ , all FETs in the H-bridge are disabled for a duration of  $t_{RETRY}$ . After that, the H-bridge re-enables according to the state of the INx pins. If the overcurrent fault is still present, the cycle repeats; otherwise normal device operation resumes.

#### 7.3.5.3 Thermal Shutdown (TSD)

If the die temperature exceeds safe limits, all FETs in the H-bridge is disabled. After the die temperature has fallen to a safe level, operation automatically resumes.

表 2. Protection Functionality

FAULT	CONDITION	H-BRIDGE BECOMES	NFAULT BECOMES	RECOVERY
VM undervoltage lockout (UVLO)	$VM < V_{UVLO}$	Disabled	Low	$VM > V_{UVLO}$
Overcurrent (OCP)	$I_{OUT} > I_{OCP}$	Disabled	Low	$t_{RETRY}$
Thermal shutdown (TSD)	$T_J > 150^{\circ}C$	Disabled	Low	$T_J < T_{SD} - T_{HYS}$

## 7.4 Device Functional Modes

The DRV8872 device can be used in multiple ways to drive a brushed DC motor.

### 7.4.1 PWM With Current Regulation

This scheme uses all of the capabilities of the device. The  $I_{TRIP}$  current is set above the normal operating current, and high enough to achieve an adequate spin-up time, but low enough to constrain current to a desired level. Motor speed is controlled by the duty cycle of one of the inputs, while the other input is static. Brake and slow decay is typically used during the off-time.

### 7.4.2 PWM Without Current Regulation

If current regulation is not needed, the ISEN pin should be directly connected to the PCB ground plane. This mode provides the highest possible peak current: up to 3.6 A for a few hundred milliseconds (depending on PCB characteristics and the ambient temperature). If current exceeds 3.6 A, the device might reach overcurrent protection (OCP) or over-temperature shutdown (TSD). If that occurs, the device disables and protects itself for about 3 ms ( $t_{RETRY}$ ) and then resumes normal operation.

### 7.4.3 Static Inputs With Current Regulation

The IN1 and IN2 pins can be set high and low for 100% duty cycle drive, and ITRIP can be used to control the current, speed, and torque capability of the motor.

### 7.4.4 VM Control

In some systems, varying VM as a means of changing motor speed is desirable. See the [Motor Voltage](#) section for more information.

## 8 Application and Implementation

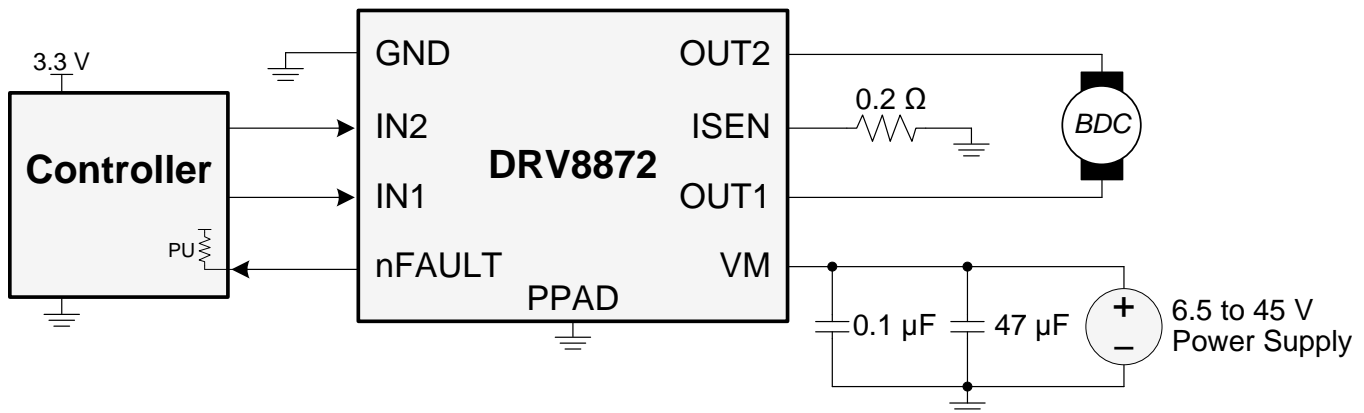

注

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

### 8.1 Application Information

The DRV8872 device is typically used to drive one brushed DC motor.

### 8.2 Typical Application

Copyright © 2016, Texas Instruments Incorporated

图 7. Typical Connections

#### 8.2.1 Design Requirements

表 3 lists the design parameters.

表 3. Design Parameters

DESIGN PARAMETER	REFERENCE	EXAMPLE VALUE
Motor voltage	$V_M$	24 V
Motor RMS current	$I_{RMS}$	0.8 A
Motor startup current	$I_{START}$	2 A
Motor current trip point	$I_{TRIP}$	2.2 A
Sense resistance	$R_{ISEN}$	0.16 $\Omega$
PWM frequency	$f_{PWM}$	5 kHz

#### 8.2.2 Detailed Design Procedure

##### 8.2.2.1 Motor Voltage

The motor voltage used depends on the ratings of the motor selected and the desired RPM. A higher voltage spins a brushed DC motor faster with the same PWM duty cycle applied to the power FETs. A higher voltage also increases the rate of current change through the inductive motor windings.

##### 8.2.2.2 Drive Current

The current path is through the high-side sourcing DMOS power driver, motor winding, and low-side sinking DMOS power driver. Power dissipation losses in one source and sink DMOS power driver are shown in 公式 2.

$$P_D = I^2 (R_{DS(on)Source} + R_{DS(on)Sink}) \quad (2)$$

The DRV8872 device has been measured to be capable of 2-A RMS current at 25°C on standard FR-4 PCBs. The maximum RMS current varies based on the PCB design, ambient temperature, and PWM frequency. Typically, switching the inputs at 200 kHz compared to 20 kHz causes 20% more power loss in heat.

### 8.2.2.3 Sense Resistor

For optimal performance, the sense resistor must have the features that follow:

- Surface-mount device
- Low inductance
- Rated for high enough power
- Placed closely to the motor driver

The power dissipated by the sense resistor equals  $I_{RMS}^2 \times R$ . For example, if peak motor current is 3 A, RMS motor current is 1.5 A, and a 0.2-Ω sense resistor is used, the resistor dissipates  $1.5 A^2 \times 0.2 \Omega = 0.45 W$ . The power quickly increases with higher current levels.

Resistors typically have a rated power within some ambient temperature range, along with a derated power curve for high ambient temperatures. When a PCB is shared with other components generating heat, the system designer should add margin. It is always best to measure the actual sense resistor temperature in a final system.

Because power resistors are larger and more expensive than standard resistors, multiple standard resistors can be used in parallel, between the sense node and ground. This configuration distributes the current and heat dissipation.

### 8.2.3 Application Curves

图 10. Current Ramp With a 2-Ω, 1 mH, RL Load and VM = 45 V

图 11.  $t_{pd}$

图 12. Current Regulation With  $R_{SENSE} = 0.26 \Omega$

图 13. OCP With 24 V and Outputs Shorted Together

## 9 Power Supply Recommendations

### 9.1 Bulk Capacitance

Having appropriate local bulk capacitance is an important factor in motor drive system design. More bulk capacitance is generally beneficial but with the disadvantages of increased cost and physical size.

The amount of local capacitance needed depends on a variety of factors, including:

- The highest current required by the motor system
- The power supply's capacitance and ability to source current
- The amount of parasitic inductance between the power supply and motor system
- The acceptable voltage ripple
- The type of motor used (brushed DC, brushless DC, stepper)
- The motor braking method

The inductance between the power supply and motor drive system limits the rate that the current can change from the power supply. If the local bulk capacitance is too small, the system responds to excessive current demands or dumps from the motor with a change in voltage. When adequate bulk capacitance is used, the motor voltage remains stable and high current can be quickly supplied.

The data sheet generally provides a recommended value, but system-level testing is required to determine the appropriate sized bulk capacitor.

图 14. Example Setup of Motor Drive System With External Power Supply

The voltage rating for bulk capacitors should be higher than the operating voltage, to provide margin for cases when the motor transfers energy to the supply.

## 10 Layout

### 10.1 Layout Guidelines

The bulk capacitor should be placed to minimize the distance of the high-current path through the motor driver device. The connecting metal trace widths should be as wide as possible, and numerous vias should be used when connecting PCB layers. These practices minimize inductance and allow the bulk capacitor to deliver high current.

Small-value capacitors should be ceramic, and placed closely to device pins.

The high-current device outputs should use wide metal traces.

The device thermal pad should be soldered to the PCB top-layer ground plane. Multiple vias should be used to connect to a large bottom-layer ground plane. The use of large metal planes and multiple vias help dissipate the  $I^2 \times R_{DS(on)}$  heat that is generated in the device.

图 15 shows the recommended layout and component placement.

### 10.2 Layout Example

图 15. Layout Recommendation

### 10.3 Thermal Considerations

The DRV8872 device has thermal shutdown (TSD) as described in the [Thermal Shutdown \(TSD\)](#) section. If the die temperature exceeds approximately 175°C, the device is disabled until the temperature drops below the temperature hysteresis level.

Any tendency of the device to enter TSD is an indication of either excessive power dissipation, insufficient heatsinking, or too high of an ambient temperature.

### 10.4 Power Dissipation

Power dissipation in the DRV8872 device is dominated by the power dissipated in the output FET resistance,  $R_{DS(on)}$ . Use 公式 2 from the [Drive Current](#) section to calculate the estimated average power dissipation of when driving a load.

Note that at startup, the output current is much higher than normal running current; this peak current and its duration must be also be considered.

## Power Dissipation (接下页)

The maximum amount of power that can be dissipated in the device is dependent on ambient temperature and heatsinking.

### 注

$R_{DS(on)}$  increases with temperature, so as the device heats, the power dissipation increases. This fact must be taken into consideration when sizing the heatsink.

The power dissipation of the DRV8872 is a function of RMS motor current and the FET resistance ( $R_{DS(ON)}$ ) of each output.

$$\text{Power} \approx I_{RMS}^2 \times (\text{High-side } R_{DS(ON)} + \text{Low-side } R_{DS(ON)}) \quad (3)$$

For this example, the ambient temperature is 58°C, and the junction temperature reaches 80°C. At 58°C, the sum of  $R_{DS(ON)}$  is about 0.72 Ω. With an example motor current of 0.8 A, the dissipated power in the form of heat is  $0.8 \text{ A}^2 \times 0.72 \text{ } \Omega = 0.46 \text{ W}$ .

The temperature that the DRV8872 reaches depends on the thermal resistance to the air and PCB. Soldering the device PowerPAD to the PCB ground plane, with vias to the top and bottom board layers, is important to dissipate heat into the PCB and reduce the device temperature. In the example used here, the DRV8872 had an effective thermal resistance  $R_{\theta JA}$  of 48°C/W, and a  $T_J$  value as shown in [公式 4](#).

$$T_J = T_A + (P_D \times R_{\theta JA}) = 58^\circ\text{C} + (0.46 \text{ W} \times 48^\circ\text{C/W}) = 80^\circ\text{C} \quad (4)$$

### 10.4.1 Heatsinking

The PowerPAD package uses an exposed pad to remove heat from the device. For proper operation, this pad must be thermally connected to copper on the PCB to dissipate heat. On a multi-layer PCB with a ground plane, this connection can be accomplished by adding a number of vias to connect the thermal pad to the ground plane.

On PCBs without internal planes, a copper area can be added on either side of the PCB to dissipate heat. If the copper area is on the opposite side of the PCB from the device, thermal vias are used to transfer the heat between top and bottom layers.

For details about how to design the PCB, refer to the TI application report, [PowerPAD™ Thermally Enhanced Package](#) (SLMA002), and the TI application brief, [PowerPAD Made Easy™](#) (SLMA004), available at [www.ti.com](http://www.ti.com). In general, the more copper area that can be provided, the more power can be dissipated.

### 11.2 接收文档更新通知

如需接收文档更新通知, 请访问 [www.ti.com.cn](http://www.ti.com.cn) 网站上的器件产品文件夹。点击右上角的[提醒我 \(Alert me\)](#) 注册后, 即可每周定期收到已更改的产品信息。有关更改的详细信息, 请查阅已修订文档中包含的修订历史记录。

### 11.3 社区资源

The following links connect to TI community resources. Linked contents are provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's [Terms of Use](#).

**TI E2E™ Online Community** *TI's Engineer-to-Engineer (E2E) Community*. Created to foster collaboration among engineers. At [e2e.ti.com](http://e2e.ti.com), you can ask questions, share knowledge, explore ideas and help solve problems with fellow engineers.

**Design Support** *TI's Design Support* Quickly find helpful E2E forums along with design support tools and contact information for technical support.

### 11.4 商标

PowerPAD, E2E are trademarks of Texas Instruments.  
All other trademarks are the property of their respective owners.

### 11.5 静电放电警告

ESD 可能会损坏该集成电路。德州仪器 (TI) 建议通过适当的预防措施处理所有集成电路。如果不遵守正确的处理措施和安装程序, 可能会损坏集成电路。

ESD 的损坏小至导致微小的性能降级, 大至整个器件故障。精密的集成电路可能更容易受到损坏, 这是因为非常细微的参数更改都可能会导致器件与其发布的规格不相符。

### 11.6 Glossary

[SLYZ022](#) — *TI Glossary*.

This glossary lists and explains terms, acronyms, and definitions.

## 12 机械、封装和可订购信息

以下页中包括机械、封装和可订购信息。这些信息是针对指定器件可提供的最新数据。这些数据会在无通知且不对本文档进行修订的情况下发生改变。欲获得该数据表的浏览器版本, 请查阅左侧的导航栏。

**PACKAGING INFORMATION**

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead finish/ Ball material (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
DRV8872DDA	ACTIVE	SO PowerPAD	DDA	8	75	RoHS & Green	NIPDAUAG	Level-2-260C-1 YEAR	-40 to 125	8872	<a href="#">Samples</a>
DRV8872DDAR	ACTIVE	SO PowerPAD	DDA	8	2500	RoHS & Green	NIPDAUAG	Level-2-260C-1 YEAR	-40 to 125	8872	<a href="#">Samples</a>

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

**RoHS Exempt:** TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

**Green:** TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

**Important Information and Disclaimer:**The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

PowerPAD™ PLASTIC SMALL-OUTLINE

4202561/F 12/11

- NOTES:
- A. All linear dimensions are in millimeters. Dimensioning and tolerancing per ASME Y14.5-1994.
  - B. This drawing is subject to change without notice.
  - C. Body dimensions do not include mold flash or protrusion not to exceed 0,15.
  - D. This package is designed to be soldered to a thermal pad on the board. Refer to Technical Brief, PowerPad Thermally Enhanced Package, Texas Instruments Literature No. SLMA002 for information regarding recommended board layout. This document is available at [www.ti.com](http://www.ti.com) <<http://www.ti.com>>.
  - E. See the additional figure in the Product Data Sheet for details regarding the exposed thermal pad features and dimensions.
  - F. This package complies to JEDEC MS-012 variation BA

PowerPAD is a trademark of Texas Instruments.

DDA (R-PDSO-G8)

PowerPAD™ PLASTIC SMALL OUTLINE

## THERMAL INFORMATION

This PowerPAD™ package incorporates an exposed thermal pad that is designed to be attached to a printed circuit board (PCB). The thermal pad must be soldered directly to the PCB. After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For additional information on the PowerPAD package and how to take advantage of its heat dissipating abilities, refer to Technical Brief, PowerPAD Thermally Enhanced Package, Texas Instruments Literature No. SLMA002 and Application Brief, PowerPAD Made Easy, Texas Instruments Literature No. SLMA004. Both documents are available at [www.ti.com](http://www.ti.com).

The exposed thermal pad dimensions for this package are shown in the following illustration.

Exposed Thermal Pad Dimensions

4206322-6/L 05/12

NOTE: A. All linear dimensions are in millimeters

PowerPAD is a trademark of Texas Instruments

- NOTES:
- A. All linear dimensions are in millimeters.
  - B. This drawing is subject to change without notice.
  - C. Publication IPC-7351 is recommended for alternate designs.
  - D. This package is designed to be soldered to a thermal pad on the board. Refer to Technical Brief, PowerPad Thermally Enhanced Package, Texas Instruments Literature No. SLMA002, SLMA004, and also the Product Data Sheets for specific thermal information, via requirements, and recommended board layout. These documents are available at [www.ti.com](http://www.ti.com) <<http://www.ti.com>>. Publication IPC-7351 is recommended for alternate designs.
  - E. Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Example stencil design based on a 50% volumetric metal load solder paste. Refer to IPC-7525 for other stencil recommendations.
  - F. Customers should contact their board fabrication site for solder mask tolerances between and around signal pads.

PowerPAD is a trademark of Texas Instruments.

## 重要声明和免责声明
