

# 具有系统功率监测器和处理器热量监测器的 bq25700A SMBus 多化合物电池降压/升压充电控制器

## 1 特性

- 从各种输入源为 1 至 4 节电池充电
  - 3.5V 至 24V 输入工作电压
  - 支持 USB 2.0、USB 3.0、USB 3.1 (Type-C) 和 USB\_PD 输入电流设置
  - 在降压和升压操作之间进行无缝转换
  - 提供输入电流和电压调节 (IDPM 和 VDPM) 以防电源过载
- 用于 CPU 节流的功率/电流监控器
  - 综合 PROCHOT 设置, 符合 IMVP8
  - 输入和电池电流监控器
  - 系统功率监控器, 符合 IMVP8
- 窄 VDC (NVDC) 电源路径管理
  - 无需电池或使用深度放电的电池亦可瞬时启动
  - 适配器满载时, 电池可为系统补充电量
- 从电池给 USB 端口加电 (USB OTG)
  - 输出 4.48V 至 20.8V 与 USB PD 兼容
  - 输出电流限制高达 6.35A
- 用于 1 $\mu$ H 至 3.3 $\mu$ H 电感器的 800kHz 或 1.2MHz 可编程开关频率
- 可通过主机控制接口实现灵活系统配置
  - SMBus (bq25700A) 端口用于优化系统性能和状态报告
  - 硬件引脚可用于设置输入电流限制, 无需 EC 控制
- 集成型 ADC 可监控电压、电流和功率
- 高精度调节和监控
  - $\pm 0.5\%$  充电电压调节
  - $\pm 2\%$  输入/充电电流调节
  - $\pm 2\%$  输入/充电电流监控
  - $\pm 5\%$  功率监控器
- 安全性
  - 热关断
  - 输入、系统、电池过电压保护
  - MOSFET 电感过流保护
- 低电池静态电流

- 输入电流优化器 (ICO) 可获取最大输入功率
- 为任意化学电池充电: Li+, LiFePO<sub>4</sub>、镍镉、镍氢、铅酸
- 封装: 32 引脚 4 x 4 WQFN

## 2 应用

- 超极本、笔记本、可拆卸电脑、平板电脑和移动电源
- 工业用和医疗用设备
- 带可充电电池的便携式设备

## 3 说明

bq25700A 是一种同步 NVDC 电池降压/升压充电控制器, 为空间受限的多化合物电池充电应用提供了组件数量少的高效解决方案。

NVDC-1 配置可将系统电压稳定在电池电压范围内, 但不会低于系统最小电压。即便在电池完全放电或被取出时, 系统也仍会继续工作。当负载功率超过输入源额定值时, 电池会进入补电模式并防止系统崩溃。

The bq25700A 从 USB 适配器、高电压 USB PD 源和传统适配器等各种输入源为电池充电。

### 器件信息 (1)

| 器件型号     | 封装        | 封装尺寸 (标称值)      |
|----------|-----------|-----------------|
| bq25700A | WQFN (32) | 4.00mm x 4.00mm |

(1) 如需了解所有可用封装, 请参阅产品说明书末尾的可订购产品附录。

## 4 修订历史记录

| Changes from Original (May 2017) to Revision A  | Page |
|---|------|
| • 已删除 删除了“特性”中补电模式下的理想二极管 运行 .....  | 1    |
| • 已更改 将 2.2μH 改为 3.3μH 并删除了“特性”中的 低厚度 .....   | 1    |
| • 已添加 在“特性”中增加了可监控电压、电流和功率的 集成型 ADC .....   | 1    |
| • 已更改 将“说明”中的输入源从“过载”改为“防止系统崩溃” .....   | 1    |
| • Changed 18.5 V for 3-cell, and 19.5 for 4-cell to 19.5 V for 3-cell/4-cell in CELL_BATPRESZ description .....   | 5    |
| • Changed I to O for CMPOUT I/O .....   | 6    |
| • Changed $V_{(IADP)}$ to $V_{(IADPT)}$ in IADPT description .....  | 6    |
| • Deleted minimum 10-ms and added minimum to $\overline{\text{PROCHOT}}$ description .....  | 6    |
| • Changed REG0x3B to REG0x3D in $V_{\text{DPM\_REG\_ACC}}$ Test Conditions in <a href="#">Electrical Characteristics</a> .....                          | 11   |
| • Changed REG0x3D to REG0x3B in $V_{\text{OTG\_REG\_ACC}}$ Test Conditions in <a href="#">Electrical Characteristics</a> .....                          | 11   |
| • Changed REG0x12[15] = 0 to REG0x12[15] = 1 in Test Conditions for $I_{\text{BAT\_BATFET\_ON}}$ .....  | 11   |
| • Changed REG0x12[15] = 0 to REG0x12[15] = 1 in Test Conditions for $I_{\text{BAT\_BATFET\_ON}}$ .....  | 11   |
| • Changed $I_{\text{BATOVVP}}$ test condition from: on SRP and SRN to: on VSYS pin .....  | 14   |
| • Added overbar to (BATDRV) in heading .....  | 16   |
| • 已添加 overbar to PROCHOT in Overview .....  | 21   |
| • 已更改 18.5V to 19.5V in 3S row SYSOVP column in <a href="#">表 1</a> .....   | 23   |
| • 已更改 0 to 0 A, lowside to low-side, and LSFET turn-on to LSFET turn-on when the HSFET is off in <a href="#">Continuous Conduction Mode (CCM)</a> ..... | 24   |
| • 已更改 <a href="#">Pulse Frequency Modulation (PFM)</a> .....  | 24   |
| • 已更改 during forward mode to during forward supplement mode in <a href="#">High-Accuracy Current Sense Amplifier (IADPT and IBAT)</a> .....             | 25   |
| • 已更改 <a href="#">Processor Hot Indication</a> .....  | 26   |
| • 已更改 IADP to IADPT in <a href="#">图 13</a> .....   | 27   |
| • 已更改 bq2570x to bq2570xA in <a href="#">图 14</a> .....   | 28   |
| • 已添加 overbar to PROCHOT in <a href="#">PROCHOT Status</a> .....  | 28   |

**修订历史记录 (接下页)**

|  |    |
|--|----|
| • 已更改 subscript of $I_{LIM2\_VTH}$ in <a href="#">Input Overcurrent Protection (ACOC)</a> .....  | 28 |
| • 已更改 3s – 18.5 V to 3s/4s – 19.5 V in <a href="#">System Overvoltage Protection (SYSOVP)</a> .....  | 29 |
| • 已添加 REG to <a href="#">Battery Charging</a> .....  | 29 |
| • 已更改 0 mA – 6350 mA to 50 mA – 6400 mA for 3Fh in <a href="#">表 6</a> .....   | 33 |
| • 已更改 Device Address to DeviceID for FFh in <a href="#">表 6</a> .....  | 33 |
| • 已添加 <default at POR> to PWM_FREQ description in <a href="#">表 7</a> .....  | 35 |
| • 已添加 sentence to IBAT_GAIN description in <a href="#">表 8</a> .....   | 35 |
| • 已更改 LDO to internal resistor in EN_LDO description in <a href="#">表 8</a> .....  | 35 |
| • 已删除 Independent Comparator Reference in <a href="#">表 10</a> .....   | 36 |
| • 已删除 Independent Comparator Polarity in <a href="#">表 10</a> .....  | 37 |
| • 已删除 Independent Comparator Deglitch Time in <a href="#">表 10</a> .....   | 37 |
| • 已添加 independent to FORCE_LATCHOFF description in <a href="#">表 10</a> .....  | 37 |
| • 已添加 <default at POR> to BATFETOFF_HIZ description in <a href="#">表 14</a> .....  | 40 |
| • 已添加 <default at POR> to PSYS_OTG_IDCHG description in <a href="#">表 14</a> .....   | 40 |
| • 已添加 $\overline{PROCHOT}$ Pulse Extension Enable to EN_PROCHOT_EXT description in <a href="#">表 16</a> .....                                | 41 |
| • 已添加 There is a 128 mA offset. to IDCHG_VTH description in <a href="#">表 17</a> .....   | 43 |
| • 已更改 0 mA to 000000b in IDCHG_VTH description in <a href="#">表 17</a> .....   | 43 |
| • 已更改 text in <a href="#">ChargeCurrent Register (SMBus address = 14h) [reset = 0h]</a> .....  | 49 |
| • 已删除 text and changed larger to 20-m $\Omega$ in <a href="#">Input Current Registers</a> .....  | 54 |
| • 已添加 paragraph to <a href="#">IIN_HOST Register With 10-m<math>\Omega</math> Sense Resistor (SMBus address = 3Fh) [reset = 4000h]</a> ..... | 55 |
| • 已更改 Minimum System Voltage from 614 mV to 6144 mV in <a href="#">Design Requirements</a> .....   | 66 |
| • 已删除 Input Snubber and Filter for Voltage Spike Damping section .....   | 66 |

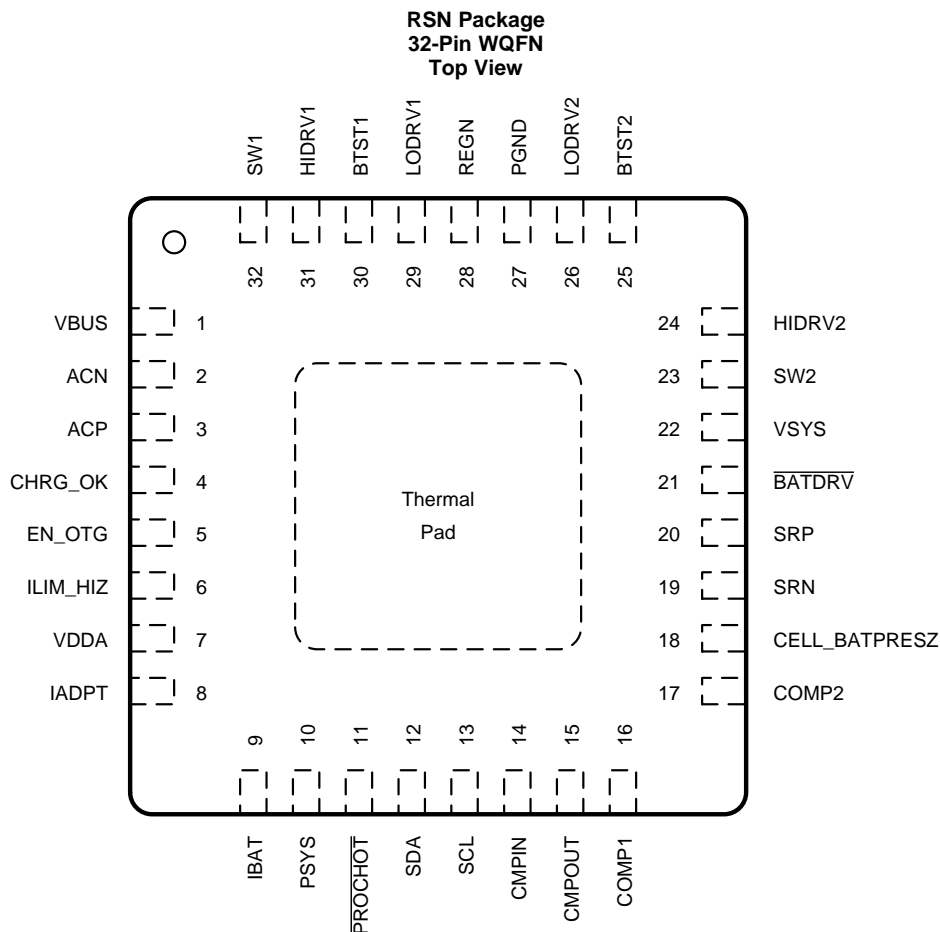

## 5 说明（续）

在加电期间，充电器基于输入源和电池状况，将转换器设置为降压、升压或降压/升压配置。充电器自动在降压、升压、降压/升压配置间转换，无需主机控制。

在无输入源的情况下，bq25700A 可通过 1 到 4 节电池支持 On-the-Go (OTG) 功能，从而在 VBUS 上生成 4.48V 至 20.8V 电压。在 OTG 模式下，充电器调节输出电压和输出电流。

bq25700A 可监控适配器电流、电池电流和系统功率。灵活编程的  $\overline{\text{PROCHOT}}$  输出直达 CPU，可根据需要降低其频率。

## 6 Pin Configuration and Functions

### Pin Functions

| PIN                        |        | I/O | DESCRIPTION   |
|----------------------------|--------|-----|---|
| NAME                       | NUMBER |     |   |
| ACN                        | 2      | PWR | Input current sense resistor negative input. The leakage on ACP and ACN are matched. The series resistors on the ACP and ACN pins are placed between sense resistor and filter cap. Refer to <a href="#">Application and Implementation</a> for ACP/ACN filter design.  |
| ACP                        | 3      | PWR | Input current sense resistor positive input. The leakage on ACP and ACN are matched. The series resistors on the ACP and ACN pins are placed between sense resistor and filter cap. Refer to <a href="#">Application and Implementation</a> for ACP/ACN filter design.  |
| $\overline{\text{BATDRV}}$ | 21     | O   | P-channel battery FET (BATFET) gate driver output. It is shorted to VSYS to turn off the BATFET. It goes 10 V below VSYS to fully turn on BATFET. BATFET is in linear mode to regulate VSYS at minimum system voltage when battery is depleted. BATFET is fully on during fast charge and supplement mode.  |
| BTST1                      | 30     | PWR | Buck mode high side power MOSFET driver power supply. Connect a 0.047- $\mu\text{F}$ capacitor between SW1 and BTST1. The bootstrap diode between REGN and BTST1 is integrated.   |
| BTST2                      | 25     | PWR | Boost mode high side power MOSFET driver power supply. Connect a 0.047- $\mu\text{F}$ capacitor between SW2 and BTST2. The bootstrap diode between REGN and BTST2 is integrated.  |
| CELL_BATPRESZ              | 18     | I   | Battery cell selection pin for 1–4 cell battery setting. CELL_BATPRESZ pin is biased from VDDA. CELL_BATPRESZ pin also sets SYSOVP threshold to 5 V for 1-cell, 12 V for 2-cell, and 19.5 V for 3-cell/4-cell. CELL_BATPRESZ pin is pulled below $V_{\text{CELL\_BATPRESZ\_FALL}}$ to indicate battery removal. The device exits LEARN mode, and disables charge. REG0x15() goes back to default. |

**Pin Functions (continued)**

| PIN      |        | I/O | DESCRIPTION   |
|----------|--------|-----|---|
| NAME     | NUMBER |     |   |
| CHRG_OK  | 4      | O   | Open drain active high indicator to inform the system good power source is connected to the charger input. Connect to the pullup rail via 10-kΩ resistor. When VBUS rises above 3.5V or falls below 24.5V, CHRG_OK is HIGH after 50ms deglitch time. When VBUS is falls below 3.2 V or rises above 26 V, CHRG_OK is LOW. When fault occurs, CHRG_OK is asserted LOW.  |
| CMPIN    | 14     | I   | Input of independent comparator. The independent comparator compares the voltage sensed on CMPIN pin to internal reference, and its output is on CMPOUT pin. Internal reference, output polarity and deglitch time is selectable by SMBus. With polarity HIGH (REG0x30[6] = 1), place a resistor between CMPIN and CMPOUT to program hysteresis. With polarity LOW (REG0x30[6] = 0), the internal hysteresis is 100 mV. If the independent comparator is not in use, tie CMPIN to ground.   |
| CMPOUT   | 15     | O   | Open-drain output of independent comparator. Place pullup resistor from CMPOUT to pullup supply rail. Internal reference, output polarity and deglitch time are selectable by SMBus.  |
| COMP2    | 17     | I   | Buck boost converter compensation pin 2. Refer to bq25700 EVM schematic for COMP2 pin RC network.   |
| COMP1    | 16     | I   | Buck boost converter compensation pin 1. Refer to bq25700 EVM schematic for COMP1 pin RC network.   |
| EN_OTG   | 5      | I   | Active HIGH to enable OTG mode. When EN_OTG pin is HIGH and REG0x32[13] is HIGH, OTG can be enabled, refer to <a href="#">USB On-The-Go (OTG)</a> for details of how to enable OTG function   |
| HIDRV1   | 31     | O   | Buck mode high side power MOSFET (Q1) driver. Connect to high side n-channel MOSFET gate.   |
| HIDRV2   | 24     | O   | Boost mode high side power MOSFET(Q4) driver. Connect to high side n-channel MOSFET gate.   |
| IADPT    | 8      | I/O | Buffered adapter current output. $V_{(IADPT)} = 20 \text{ or } 40 \times (V_{(ACP)} - V_{(ACN)})$ . With ratio selectable in REG0x12[4]. Place a resistor from the IADPT pin to ground corresponding to inductor in use. For 2.2 μH, the resistor is 137 kΩ. Place 100-pF or less ceramic decoupling capacitor from IADPT pin to ground. IADPT output voltage is clamped below 3.3 V.   |
| IBAT     | 9      | O   | Buffered battery current selected by SMBus. $V_{(IBAT)} = 8 \text{ or } 16 \times (V_{(SRP)} - V_{(SRN)})$ for charge current, or $V_{(IBAT)} = 8 \text{ or } 16 \times (V_{(SRN)} - V_{(SRP)})$ for discharge current, with ratio selectable in REG0x12[3]. Place 100-pF or less ceramic decoupling capacitor from IBAT pin to ground. This pin can be floating if not in use. Its output voltage is clamped below 3.3 V.  |
| ILIM_HIZ | 6      | I   | Input current limit input. Program ILIM_HIZ voltage by connecting a resistor divider from supply rail to ILIM_HIZ pin to ground. The pin voltage is calculated as: $V_{(ILIM\_HIZ)} = 1 \text{ V} + 40 \times \text{IDPM} \times \text{RAC}$ , in which IDPM is the target input current. The input current limit used by the charger is the lower setting of ILIM_HIZ pin and REG0x3F(). When the pin voltage is below 0.4 V, the device enters Hi-Z mode with low quiescent current. When the pin voltage is above 0.8 V, the device is out of Hi-Z mode. |
| LODRV1   | 29     | O   | Buck mode low side power MOSFET (Q2) driver. Connect to low side n-channel MOSFET gate.   |
| LODRV2   | 26     | O   | Boost mode low side power MOSFET (Q3) driver. Connect to low side n-channel MOSFET gate.  |
| PGND     | 27     | GND | Device power ground.  |
| PROCHOT  | 11     | O   | Active low open drain output of processor hot indicator. It monitors adapter input current, battery discharge current, and system voltage. After any event in the PROCHOT profile is triggered, a pulse is asserted. The minimum pulse width is adjustable in REG0x33[5:2].   |
| PSYS     | 10     | O   | Current mode system power monitor. The output current is proportional to the total power from the adapter and battery. The gain is selectable through SMBus. Place a resistor from PSYS to ground to generate output voltage. This pin can be floating if not in use. Its output voltage is clamped below 3.3 V. Place a capacitor in parallel with the resistor for filtering.   |
| REGN     | 28     | PWR | 6-V linear regulator output supplied from VBUS or VSYS. The LDO is active when VBUS above $V_{VBUS\_CONVEN}$ . Connect a 2.2- or 3.3-μF ceramic capacitor from REGN to power ground. REGN pin output is for power stage gate drive.   |
| SCL      | 13     | I   | SMBus clock input. Connect to clock line from the host controller or smart battery. Connect a 10-kΩ pullup resistor according to SMBus specifications.  |
| SDA      | 12     | I/O | SMBus open-drain data I/O. Connect to data line from the host controller or smart battery. Connect a 10-kΩ pullup resistor according to SMBus specifications.   |

**Pin Functions (continued)**

| PIN         |        | I/O | DESCRIPTION  |
|-------------|--------|-----|--|
| NAME        | NUMBER |     |  |
| SRN         | 19     | PWR | Charge current sense resistor negative input. SRN pin is for battery voltage sensing as well. Connect SRN pin with optional 0.1- $\mu$ F ceramic capacitor to GND for common-mode filtering. Connect a 0.1- $\mu$ F ceramic capacitor from SRP to SRN to provide differential mode filtering. The leakage current on SRP and SRN are matched. For reverse battery plug-in protection, 10- $\Omega$ series resistors are placed on SRP and SRN. |
| SRP         | 20     | PWR | Charge current sense resistor positive input. Connect 0.1- $\mu$ F ceramic capacitor from SRP to SRN to provide differential mode filtering. The leakage current on SRP and SRN are matched. For reverse battery plug-in protection, 10- $\Omega$ series resistors are placed on SRP and SRN. Connect SRP pin with optional 0.1- $\mu$ F ceramic capacitor to GND for common-mode filtering.   |
| SW1         | 32     | PWR | Buck mode high side power MOSFET driver source. Connect to the source of the high side n-channel MOSFET.   |
| SW2         | 23     | PWR | Boost mode high side power MOSFET driver source. Connect to the source of the high side n-channel MOSFET.  |
| VBUS        | 1      | PWR | Charger input voltage. An input low pass filter of 1 $\Omega$ and 0.47 $\mu$ F (minimum) is recommended.   |
| VDDA        | 7      | PWR | Internal reference bias pin. Connect a 10- $\Omega$ resistor from REGN to VDDA and a 1- $\mu$ F ceramic capacitor from VDDA to power ground.   |
| VSYS        | 22     | PWR | Charger system voltage sensing. The system voltage regulation limit is programmed in REG0x15() and REG0x3E().  |
| Thermal pad | –      | –   | Exposed pad beneath the IC. Analog ground and power ground star-connected near the IC's ground. Always solder thermal pad to the board, and have vias on the thermal pad plane connecting to power ground planes. It also serves as a thermal pad to dissipate the heat.   |

## 7 Specifications

### 7.1 Absolute Maximum Ratings

 over operating free-air temperature range (unless otherwise noted)<sup>(1)(2)</sup>

|                                   | SRP-SRN, ACP-ACN  | -0.5 | 0.5 |      |
| Junction temperature range, $T_J$ |   | -40  | 155 | °C   |
| Storage temperature, $T_{stg}$    |   | -40  | 155 | °C   |

- Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- All voltages are with respect to GND if not specified. Currents are positive into, negative out of the specified terminal. Consult Packaging Section of the data book for thermal limitations and considerations of packages.

### 7.2 ESD Ratings

|                                     |  | VALUE | UNIT |
|-------------------------------------|--|-------|------|
| $V_{(ESD)}$ Electrostatic discharge | Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 <sup>(1)</sup>              | ±2000 | V    |
|                                     | Charged-device model (CDM), per JEDEC specification JESD22-C101 <sup>(2)</sup> | ±500  |      |

- JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

### 7.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

|                                       |   | MIN   | MAX  | UNIT |
|---------------------------------------|---|-------|------|------|

| $t_{SU(STOP)}$                    | Setup time for STOP condition   | 4   |     |     | $\mu$ s |
| $t_{(BUF)}$                       | Bus free time between START and STOP condition  | 4.7 |     |     | $\mu$ s |
| $F_{S(CL)}$                       | Clock Frequency   | 10  |     | 100 | KHz     |
| <b>HOST COMMUNICATION FAILURE</b> |   |     |     |     |         |
| $t_{timeout}$                     | SMBus bus release timeout <sup>(1)</sup>  | 25  |     | 35  | ms      |
| $t_{BOOT}$                        | Deglintch for watchdog reset signal   | 10  |     |     | ms      |
| $t_{WDI}$                         | Watchdog timeout period, ChargeOption() bit [14:13] = 01 <sup>(2)</sup>               | 35  | 44  | 53  | s       |
|                                   | Watchdog timeout period, ChargeOption() bit bit [14:13] = 10 <sup>(2)</sup>           | 70  | 88  | 105 | s       |
|                                   | Watchdog timeout period, ChargeOption() bit bit [14:13] = 11 <sup>(2)</sup> (default) | 140 | 175 | 210 | s       |

- (1) Devices participating in a transfer will timeout when any clock low exceeds the 25ms minimum timeout period. Devices that have detected a timeout condition must reset the communication no later than the 35 ms maximum timeout period. Both a master and a slave must adhere to the maximum value specified as it incorporates the cumulative stretch limit for both a master (10 ms) and a slave (25 ms).
- (2) User can adjust threshold via SMBus ChargeOption() REG0x12.

Typical Characteristics (接下页)

Typical Characteristics (接下页)

## 8 Detailed Description

### 8.1 Overview

The bq25700A is a buck boost NVDC (narrow voltage DC) charge controller for multi-chemistry portable applications such as notebook, detachable, ultrabook, tablet and other mobile devices with rechargeable batteries. It provides seamless transition between converter operation modes (buck, boost, or buck boost), fast transient response, and high light load efficiency.

The bq25700A supports wide range of power sources, including USB PD ports, legacy USB ports, traditional AC-DC adapters, etc. It takes input voltage from 3.5 V to 24 V, and charges battery of 1-4 series. It also supports USB On-The-Go (OTG) to provide 4.48V to 20.8V output at USB port.

The bq25700A features Dynamic Power Management (DPM) to limit the input power and avoid AC adapter overloading. During battery charging, as the system power increases, the charging current will reduce to maintain total input current below adapter rating. If system power demand temporarily exceeds adapter rating, the bq25700A supports NVDC architecture to allow battery discharge energy to supplement system power. For details, refer to [System Voltage Regulation](#) section.

In order to be compliant with an Intel IMVP8 compliant system, the bq25700A includes PSYS function to monitor the total platform power from adapter and battery. Besides PSYS, it provides both an independent input current buffer (IADPT) and a battery current buffer (IBAT) with highly accurate current sense amplifiers. If the platform power exceeds the available power from adapter and battery, a  $\overline{\text{PROCHOT}}$  signal is asserted to CPU so that the CPU optimizes its performance to the power available to the system.

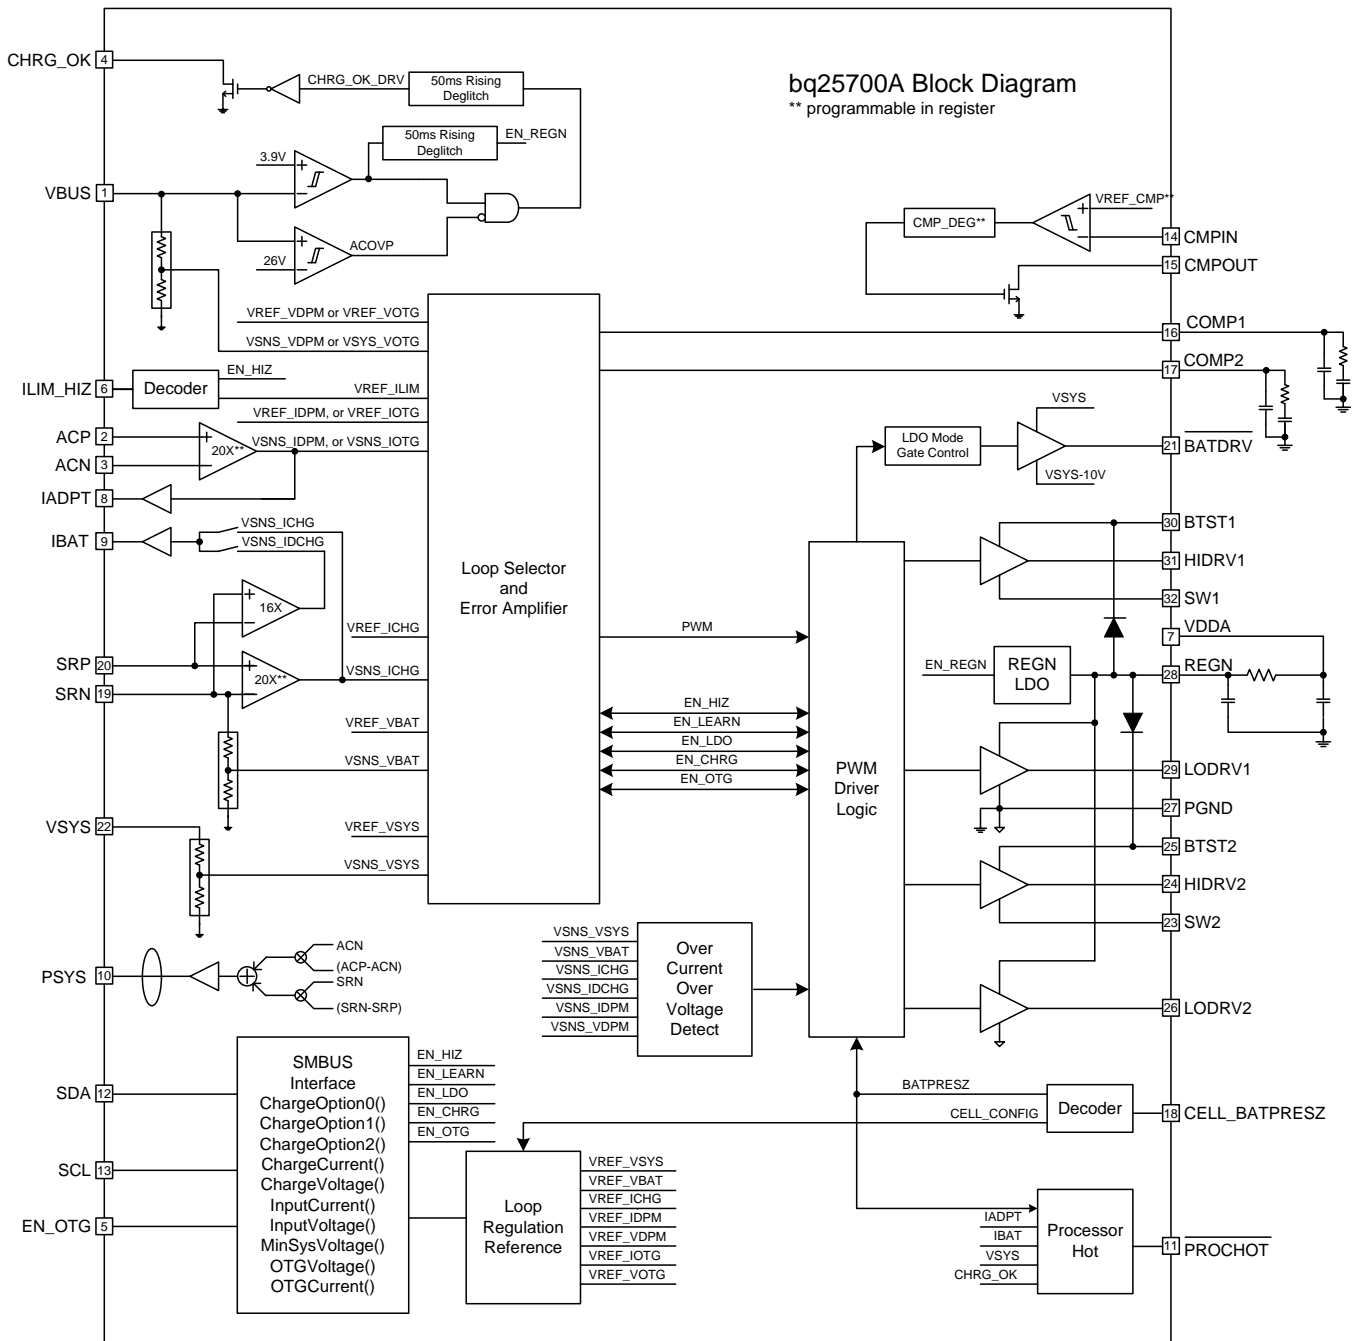

The SMBus controls input current, charge current and charge voltage registers with high resolution, high accuracy regulation limits. It also sets the  $\overline{\text{PROCHOT}}$  timing and threshold profile to meet system requirements.

## 8.3 Feature Description

### 8.3.1 Power-Up from Battery Without DC Source

If only battery is present and the voltage is above  $V_{VBAT\_UVLOZ}$ , the BATFET turns on and connects battery to system. By default, the charger is in low power mode ( $REG0x12[15] = 1$ ) with lowest quiescent current. The LDO stays off. When device moves to performance mode ( $REG0x12[15] = 0$ ), The host enables IBAT buffer through SMBus to monitor discharge current. For PSYS,  $\overline{PROCHOT}$  or independent comparator, REGN LDO is enabled for an accurate reference.

### 8.3.2 Power-Up From DC Source

When an input source plugs in, the charger checks the input source voltage to turn on LDO and all the bias circuits. It sets the input current limit before the converter starts.

The power-up sequence from DC source is as follows:

1. 50 ms after VBUS above  $V_{VBUS\_CONVEN}$ , enable 6 V LDO and CHRГ\_OK goes HIGH
2. Input voltage and current limit setup
3. Battery CELL configuration
4. 150 ms after VBUS above  $V_{VBUS\_CONVEN}$ , converter powers up.

#### 8.3.2.1 CHRГ\_OK Indicator

CHRГ\_OK is an active HIGH open drain indicator. It indicates the charger is in normal operation when the following conditions are valid:

- VBUS is above  $V_{VBUS\_CONVEN}$
- VBUS is below  $V_{ACOV}$
- No MOSFET/inductor, or over-voltage, over-current, thermal shutdown fault

#### 8.3.2.2 Input Voltage and Current Limit Setup

After CHRГ\_OK goes HIGH, the charger sets default input current limit in  $REG0x3F()$  to 3.30 A. The actual input current limit is the lower setting of  $REG0x3F()$  and ILIM\_HIZ pin.

Charger initiates a VBUS voltage measurement without any load (VBUS at no load). The default VINDPM threshold is VBUS at no load – 1.28 V.

After input current and voltage limits are set, the charger device is ready to power up. The host can always update input current and voltage limit based on input source type.

#### 8.3.2.3 Battery Cell Configuration

CELL\_BATPRESZ pin is biased with resistors from REGN to CELL\_BATPRESZ to GND. After VDDA LDO is activated, the device detects the battery configuration through CELL\_BATPRESZ pin bias voltage. Refer to [Electrical Characteristics](#) for CELL setting thresholds.

**表 1. Battery Cell Configuration**

| CELL COUNT | PIN VOLTAGE w.r.t. VDDA | BATTERY VOLTAGE (REG0x15) | SYSOVP |
|------------|-------------------------|---------------------------|--------|
| 4S         | 75%                     | 16.800V                   | 19.5V  |
| 3S         | 55%                     | 12.592V                   | 19.5V  |
| 2S         | 40%                     | 8.400V                    | 12V    |
| 1S         | 25%                     | 4.192V                    | 5V     |

#### 8.3.2.4 Device Hi-Z State

The charger enters Hi-Z mode when ILIM\_HIZ pin voltage is below 0.4 V or  $REG0x32[15]$  is set to 1. During Hi-Z mode, the input source is present, and the charger is in the low quiescent current mode with REGN LDO enabled.

### 8.3.3 USB On-The-Go (OTG)

The device supports USB OTG operation to deliver power from the battery to other portable devices through USB port. The OTG mode output voltage is set in REG0x3B(). The OTG mode output current is set in REG0x3C(). The OTG operation can be enabled if the conditions are valid:

- Valid battery voltage is set REG0x15()
- OTG output voltage is set in REG0x3B() and output current is set in REG0x3C()
- EN\_OTG pin is HIGH and REG0x32[12] = 1
- VBUS is below  $V_{VBUS\_UVLO}$
- 10 ms after the above conditions are valid, converter starts and VBUS ramps up to target voltage. CHRГ\_OK pin goes HIGH if REG0x12[11] = 1.

### 8.3.4 Converter Operation

The charger employs a synchronous buck-boost converter that allows charging from a standard 5-V or a high-voltage power source. The charger operates in buck, buck-boost and boost mode. The buck-boost can operate uninterruptedly and continuously across the three operation modes.

**表 2. MOSFET Operation**

| MODE | BUCK      | BUCK-BOOST | BOOST     |
|------|-----------|------------|-----------|
| Q1   | Switching | Switching  | ON        |
| Q2   | Switching | Switching  | OFF       |
| Q3   | OFF       | Switching  | Switching |
| Q4   | ON        | Switching  | Switching |

#### 8.3.4.1 Inductor Setting through IADPT Pin

The charger reads the inductor value through the IADPT pin.

**表 3. Inductor Setting on IADPT Pin**

| INDUCTOR IN USE | RESISTOR ON IADPT PIN |
|-----------------|-----------------------|
| 1 $\mu$ H       | 93 k $\Omega$         |
| 2.2 $\mu$ H     | 137 k $\Omega$        |
| 3.3 $\mu$ H     | 169 k $\Omega$        |

#### 8.3.4.2 Continuous Conduction Mode (CCM)

With sufficient charge current, the inductor current does not cross 0 A, which is defined as CCM. The controller starts a new cycle with ramp coming up from 200 mV. As long as error amplifier output voltage is above the ramp voltage, the high-side MOSFET (HSFET) stays on. When the ramp voltage exceeds error amplifier output voltage, HSFET turns off and low-side MOSFET (LSFET) turns on. At the end of the cycle, ramp gets reset and LSFET turns off, ready for the next cycle. There is always break-before-make logic during transition to prevent cross-conduction and shoot-through. During the dead time when both MOSFETs are off, the body-diode of the low-side power MOSFET conducts the inductor current.

During CCM, the inductor current always flows and creates a fixed two-pole system. Having the LSFET turn-on when the HSFET is off keeps the power dissipation low and allows safe charging at high currents.

#### 8.3.4.3 Pulse Frequency Modulation (PFM)

In order to improve converter light-load efficiency, the bq25700A switches to PFM control at light load. The effective switching frequency will decrease accordingly when system load decreases. The minimum frequency can be limit to 25 kHz (ChargeOption0() bit[10]=1).

### 8.3.5 Current and Power Monitor

#### 8.3.5.1 High-Accuracy Current Sense Amplifier (IADPT and IBAT)

As an industry standard, a high-accuracy current sense amplifier (CSA) is used to monitor the input current during forward charging, or output current during OTG (IADPT) and the charge/discharge current (IBAT). IADPT voltage is 20× or 40× the differential voltage across ACP and ACN. IBAT voltage is 8×/16× (during charging), or 8×/16× (during discharging) of the differential across SRP and SRN. After input voltage or battery voltage is above UVLO, IADPT output becomes valid. To lower the voltage on current monitoring, a resistor divider from CSA output to GND can be used and accuracy over temperature can still be achieved.

- $V_{(IADPT)} = 20 \text{ or } 40 \times (V_{(ACP)} - V_{(ACN)})$  during forward mode, or  $20 \text{ or } 40 \times (V_{(ACN)} - V_{(ACP)})$  during reverse OTG mode.
- $V_{(IBAT)} = 8 \text{ or } 16 \times (V_{(SRP)} - V_{(SRN)})$  during forward mode.
- $V_{(IBAT)} = 8 \text{ or } 16 \times (V_{(SRN)} - V_{(SRP)})$  during forward supplement mode, or reverse OTG mode.

A maximum 100-pF capacitor is recommended to connect on the output for decoupling high-frequency noise. An additional RC filter is optional, if additional filtering is desired. Note that adding filtering also adds additional response delay. The CSA output voltage is clamped at 3.3 V.

#### 8.3.5.2 High-Accuracy Power Sense Amplifier (PSYS)

The charger monitors total system power. During forward mode, the input adapter powers system. During reverse OTG mode, the battery powers the system and VBUS output. The ratio of PSYS current and total power  $K_{PSYS}$  can be programmed in REG0x30[9] with default 1  $\mu\text{A/W}$ . The input and charge sense resistors (RAC and RSR) are programmed in REG0x30[11:10]. PSYS voltage can be calculated with [公式 1](#) where  $I_{IN} > 0$  when adapter is in forward charging, and  $I_{BAT} > 0$  when the battery is in discharge when the battery is in discharge.

$$V_{PSYS} = R_{PSYS} \times K_{PSYS} (V_{ACP} \times I_{IN} + V_{BAT} \times I_{BAT}) \quad (1)$$

For proper PSYS functionality, RAC and RSR values are limited to 10 m $\Omega$  and 20 m $\Omega$ .

### 8.3.6 Input Source Dynamic Power Manage

Refer to [Input Current and Input Voltage Registers for Dynamic Power Management](#).

### 8.3.7 Two-Level Adapter Current Limit (Peak Power Mode)

Usually adapter can supply current higher than DC rating for a few milliseconds to tens of milliseconds. The charger employs two-level input current limit, or peak power mode, to fully utilize the overloading capability and minimize battery discharge during CPU turbo mode. Peak power mode is enabled in REG0x31[13](EN\_PKPWR\_IDPM) or REG0x31[12](EN\_PKPWR\_VSYS). The DC current limit, or  $I_{LIM1}$ , is the same as adapter DC current, set in REG0x3F(). The overloading current, or  $I_{LIM2}$ , is set in REG0x33[15:11], as a percentage of  $I_{LIM1}$ .

When the charger detects input current surge and battery discharge due to load transient, it applies  $I_{LIM2}$  for  $T_{OVL D}$  in REG0x31[15:14], first, and then  $I_{LIM1}$  for up to  $T_{MAX} - T_{OVL D}$  time.  $T_{MAX}$  is programmed in REG0x31[9:8]. After  $T_{MAX}$ , if the load is still high, another peak power cycle starts. Charging is disabled during  $T_{MAX}$ ; once  $T_{MAX}$  expires, charging continues. If  $T_{OVL D}$  is programmed higher than  $T_{MAX}$ , then peak power mode is always on.

**图 12. Two-Level Adapter Current Limit Timing Diagram**

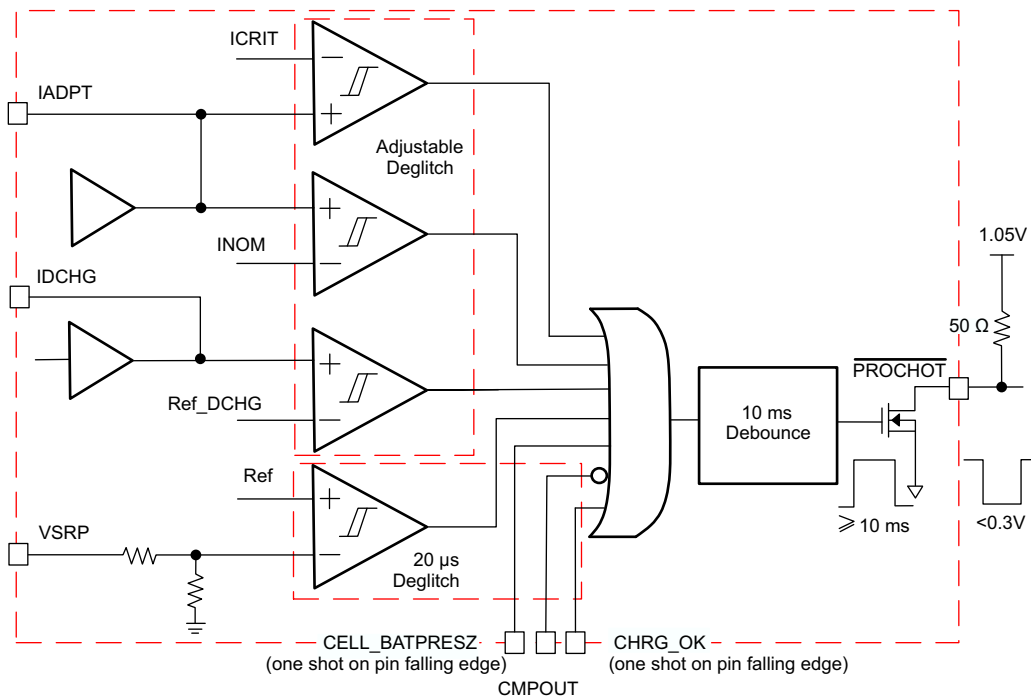

### 8.3.8 Processor Hot Indication

When CPU is running turbo mode, the system peak power may exceed available power from adapter and battery together. The adapter current and battery discharge peak current, or system voltage drop is indication that system power is too high. The charger processor hot function monitors these events, and  $\overline{\text{PROCHOT}}$  pulse is asserted. Once CPU receives  $\overline{\text{PROCHOT}}$  pulse from charger, it slows down to reduce system power. The processor hot function monitors these events, and  $\overline{\text{PROCHOT}}$  pulse is asserted.

The  $\overline{\text{PROCHOT}}$  triggering events include:

- ICRIT: adapter peak current, as 110% of  $I_{\text{LIM2}}$
- INOM: adapter average current (110% of input current limit)
- IDCHG: battery discharge current
- VSYS: system voltage on VSYS
- Adapter Removal: upon adapter removal (CHRG\_OK pin HIGH to LOW)
- Battery Removal: upon battery removal (CELL\_BATPRESZ pin goes LOW)
- CMPOUT: Independent comparator output (CMPOUT pin HIGH to LOW)

The threshold of ICRIT, IDCHG or VSYS, and the deglitch time of ICRIT, INOM, IDCHG or CMPOUT are programmable through SMBus. Each triggering event can be individually enabled in REG0x34[6:0]. When any event in  $\overline{\text{PROCHOT}}$  profile is triggered,  $\overline{\text{PROCHOT}}$  is asserted low for minimum 10 ms programmable in 0x33[4:3]. At the end of the 10 ms, if the  $\overline{\text{PROCHOT}}$  event is still active, the pulse gets extended.

Copyright © 2017, Texas Instruments Incorporated

图 13. PROCHOT Profile

### 8.3.8.1 PROCHOT During Low Power Mode

During low power mode (REG0x12[15] = 1), the charger offers a low quiescent current (~150 μA). Low power PROCHOT function uses the independent comparator to monitor battery discharge current and system voltage, and assert PROCHOT to CPU.

Below lists the register setting to enable PROCHOT during low power mode.

- REG0x12[15] = 1
- REG0x34[5:0] = 000000
- REG0x30[6:4] = 100
- Independent comparator threshold is always 1.2 V
- When REG0x30[14] = 1, charger monitors discharge current. Connect CMPIN to voltage proportional to IBAT pin. PROCHOT triggers from HIGH to LOW when CMPIN voltage falls below 1.2 V.
- When REG0x30[13] = 1, charger monitors system voltage. Connect CMPIN to voltage proportional to system. PROCHOT triggers from HIGH to LOW when CMPIN voltage rises above 1.2 V.

Copyright © 2017, Texas Instruments Incorporated

**图 14.  $\overline{\text{PROCHOT}}$  Low Power Mode Implementation**

### 8.3.8.2 $\overline{\text{PROCHOT}}$ Status

REG0x21[6:0] reports which event in the profile triggers  $\overline{\text{PROCHOT}}$  by setting the corresponding bit to 1. The status bit can be reset back to 0 after it is read by host, and current  $\overline{\text{PROCHOT}}$  event is no longer active.

Assume there are two  $\overline{\text{PROCHOT}}$  events, event A and event B. Event A triggers  $\overline{\text{PROCHOT}}$  first, but event B is also active. Both status bits will be HIGH. At the end of the 10 ms  $\overline{\text{PROCHOT}}$  pulse, if  $\overline{\text{PROCHOT}}$  is still active (either by A or B), the  $\overline{\text{PROCHOT}}$  pulse is extended.

### 8.3.9 Device Protection

#### 8.3.9.1 Watchdog Timer

The charger includes watchdog timer to terminate charging if the charger does not receive a write MaxChargeVoltage() or write ChargeCurrent() command within 175 s (adjustable via REG0x12[14:13]). When watchdog timeout occurs, all register values are kept unchanged except ChargeCurrent() resets to zero. Battery charging is suspended. Write MaxChargeVoltage() or write ChargeCurrent() commands must be re-sent to reset watchdog timer and resume charging. Writing REG0x12[14:13] = 00 to disable watchdog timer also resumes charging.

#### 8.3.9.2 Input Overvoltage Protection (ACOV)

The charger has fixed ACOV voltage. When VBUS pin voltage is higher than ACOV, it is considered as adapter over voltage. CHRГ\_OK will be pulled low, and converter will be disabled. As system falls below battery voltage, BATFET will be turned on. When VBUS pin voltage falls below ACOV, it is considered as adapter voltage returns back to normal voltage. CHRГ\_OK is pulled high by external pull up resistor. The converter resumes if enable conditions are valid.

#### 8.3.9.3 Input Overcurrent Protection (ACOC)

If the input current exceeds the 1.25x or 2x (REG0x31[2]) of  $I_{\text{LIM2\_VTH}}$  (REG0x33[15:11]) set point, converter stops switching. After 300 ms, converter starts switching again.

### 8.3.9.4 System Overvoltage Protection (SYSOVP)

When the converter starts up, the bq25700A reads CELL pin configuration and sets MaxChargeVoltage() and SYSOVP threshold (1s – 5 V, 2s – 12 V, 3s/4s – 19.5 V). Before REGx15() is written by the host, the battery configuration will change with CELL pin voltage. When SYSOVP happens, the device latches off the converter. REG20[4] is set as 1. The user can clear latch-off by either writing 0 to the SYSOVP bit or removing and plugging in the adapter again. After latch-off is cleared, the converter starts again.

### 8.3.9.5 Battery Overvoltage Protection (BATOVP)

Battery over-voltage may happen when battery is removed during charging or the user plugs in a wrong battery. The BATOVP threshold is 104% (1 s) or 102% (2 s to 4 s) of regulation voltage set in REG0x15().

### 8.3.9.6 Battery Short

If BAT voltage falls below SYSMIN during charging, the maximum current is limited to 384 mA.

### 8.3.9.7 Thermal Shutdown (TSHUT)

The WQFN package has low thermal impedance, which provides good thermal conduction from the silicon to the ambient, to keep junction temperatures low. As added level of protection, the charger converter turns off for self-protection whenever the junction temperature exceeds the 155°C. The charger stays off until the junction temperature falls below 135°C. During thermal shut down, the LDO current limit is reduced to 16 mA and REGN LDO stays off. When the temperature falls below 135°C, charge can be resumed with soft start.

## 8.4 Device Functional Modes

### 8.4.1 Forward Mode

When input source is connected to VBUS, bq25700A is in forward mode to regulate system and charge battery.

#### 8.4.1.1 System Voltage Regulation with Narrow VDC Architecture

The bq25700A employs Narrow VDC architecture (NVDC) with BATFET separating system from battery. The minimum system voltage is set by MinSystemVoltage(). Even with a deeply depleted battery, the system is regulated above the minimum system voltage.

When the battery is below minimum system voltage setting, the BATFET operates in linear mode (LDO mode).

As the battery voltage rises above the minimum system voltage, BATFET is fully on when charging or in supplement mode and the voltage difference between the system and battery is the VDS of BATFET. System voltage is regulated 160 mV above battery voltage when BATFET is off (no charging or no supplement current).

See [System Voltage Regulation](#) for details on system voltage regulation and register programming.

#### 8.4.1.2 Battery Charging

The bq25700A charges 1-4 cell battery in constant current (CC), and constant voltage (CV) mode. Based on CELL\_BATPREZ pin setting, the charger sets default battery voltage 4.2V/cell to ChargeVoltage(), or REG0x15(). According to battery capacity, the host programs appropriate charge current to ChargeCurrent(), or REG0x14(). When battery is full or battery is not in good condition to charge, host terminates charge by setting REG0x12[0] to 1, or setting ChargeCurrent() to zero.

See [Feature Description](#) for details on register programming.

### 8.4.2 USB On-The-Go

The bq25700A supports USB OTG functionality to deliver power from the battery to other portable devices through USB port (reverse mode). The OTG output voltage is compliant with USB PD specification, including 5 V, 9 V, 15 V, and 20 V (REG0x3B()). The output current regulation is compliant with USB type C specification, including 500 mA, 1.5 A, 3 A and 5 A (REG0x3C()).

Similar to forward operation, the device switches from PWM operation to PFM operation at light load to improve efficiency.

## 8.5 Programming

The charger supports battery-charger commands that use either Write-Word or Read-Word protocols, as summarized in 表 6. The SMBUS address is 12h (0001001\_X), where X is the read/write bit. The ManufacturerID and DeviceID registers are assigned identify the charger device. The ManufacturerID register command always returns 40h.

### 8.5.1 SMBus Interface

The bq25700A device operates as a slave, receiving control inputs from the embedded controller host through the SMBus interface. The bq25700A device uses a simplified subset of the commands documented in *System Management Bus Specification V1.1*, which can be downloaded from [www.smbus.org](http://www.smbus.org). The bq25700A device uses the SMBus read-word and write-word protocols (shown in 表 4 and 表 5) to communicate with the smart battery. The device performs only as a SMBus slave device with address 0b00010010 (0x12H) and does not initiate communication on the bus. In addition, the device has two identification registers, a 16-bit device ID register (0xFFH) and a 16-bit manufacturer ID register (0xFEH).

SMBus communication starts when VCC is above  $V_{(UVLO)}$ .

The data (SDA) and clock (SCL) pins have Schmitt-trigger inputs that can accommodate slow edges. Choose pullup resistors (10 k $\Omega$ ) for SDA and SCL to achieve rise times according to the SMBus specifications. Communication starts when the master signals a start condition, which is a high-to-low transition on SDA, while SCL is high. When the master has finished communicating, the master issues a stop condition, which is a low-to-high transition on SDA, while SCL is high. The bus is then free for another transmission. 图 15 and 图 16 show the timing diagram for signals on the SMBus interface. The address byte, command byte, and data bytes are transmitted between the start and stop conditions. The SDA state changes only while SCL is low, except for the start and stop conditions. Data is transmitted in 8-bit bytes and is sampled on the rising edge of SCL. Nine clock cycles are required to transfer each byte in or out of the device because either the master or the slave acknowledges the receipt of the correct byte during the ninth clock cycle. The bq25700A supports the charger commands listed in 表 4.

The ADC registers are read in the following order: VBAT, VSYS, ICHG, IDCHG, IIN, PSYS, VBUS, CMPIN. ADC is disabled in low power mode. When enabling ADC, the device exit low power mode at battery only.

### 8.6.3 ChargeCurrent Register (SMBus address = 14h) [reset = 0h]

To set the charge current, write a 16-bit ChargeCurrent() command (REG0x14h()) using the data format listed in 表 25 and 表 26.

With 10-mΩ sense resistor, the charger provides charge current range of 64 mA to 8.128 A, with a 64-mA step resolution. Upon POR, ChargeCurrent() is 0 A. Any conditions for CHRГ\_OK low except ACOV will reset ChargeCurrent() to zero. CELL\_BATPRESZ going LOW (battery removal) will reset the ChargeCurrent() register to 0 A.

Charge current is not reset in ACOC, TSHUT, power path latch off (REG0x30[1]), and SYSOVP.

A 0.1-μF capacitor between SRP and SRN for differential mode filtering is recommended; an optional 0.1-μF capacitor between SRN and ground, and an optional 0.1-μF capacitor between SRP and ground for common mode filtering. Meanwhile, the capacitance on SRP should not be higher than 0.1 μF in order to properly sense the voltage across SRP and SRN for cycle-by-cycle current detection.

The SRP and SRN pins are used to sense voltage drop across RSR with default value of 10 mΩ. However, resistors of other values can also be used. For a larger sense resistor, a larger sense voltage is given, and a higher regulation accuracy; but, at the expense of higher conduction loss. A current sensing resistor value no more than 20 mΩ is suggested.

**图 26. ChargeCurrent Register With 10-mΩ Sense Resistor (SMBus address = 14h) [reset = 0h]**

### 8.6.3.1 Battery Pre-Charge Current Clamp

During pre-charge, BATFET works in linear mode or LDO mode (default REG0x12[2] = 1). For 2-4 cell battery, the system is regulated at minimum system voltage in REG0x3E() and the pre-charge current is clamped at 384 mA. For 1 cell battery, the pre-charge to fast charge threshold is 3 V, and the pre-charge current is clamped at 384 mA. However, the BATFET stays in LDO mode operation till battery voltage is above minimum system voltage (~3.6 V). During battery voltage from 3 V to 3.6 V, the fast charge current is clamped at 2 A.

### 8.6.4 MaxChargeVoltage Register (SMBus address = 15h) [reset value based on CELL\_BATPRESZ pin setting]

To set the output charge voltage, write a 16-bit ChargeVoltage register command (REG0x15()) using the data format listed in 表 27 and 表 28. The charger provides charge voltage range from 1.024 V to 19.200 V, with 16-mV step resolution. Any write below 1.024 V or above 19.200 V is ignored. Upon POR or when charge is disabled, the system is regulated at the MaxChargeVoltage register.

Upon POR, REG0x15() is by default set as 4192 mV for 1 s, 8400 mV for 2 s, 12592 mV for 3 s or 16800 mV for 4 s. After CHRG\_OK, if host writes REG0x14() before REG0x15(), the charge will start after the write to REG0x14(). If the battery is different from 4.2 V/cell, the host has to write to REG0x15() before REG0x14() for correct battery voltage setting. Writing REG0x15() to 0 will set REG0x15() to default value on CELL\_BATPRESZ pin, and force REG0x14() to zero to disable charge.

The SRN pin is used to sense the battery voltage for voltage regulation and should be connected as close to the battery as possible, and directly place a decoupling capacitor (0.1  $\mu$ F recommended) as close to the device as possible to decouple high frequency noise.

#### 8.6.5.1 System Voltage Regulation

The device employs Narrow VDC architecture (NVDC) with BATFET separating system from battery. The minimum system voltage is set by REG0x3E(). Even with a deeply depleted battery, the system is regulated above the minimum system voltage with BATFET.

When the battery is below minimum system voltage setting, the BATFET operates in linear mode (LDO mode), and the system is regulated above the minimum system voltage setting. As the battery voltage rises above the minimum system voltage, BATFET is fully on when charging or in supplement mode and the voltage difference between the system and battery is the VDS of BATFET. System voltage is regulated 160 mV above battery voltage when BATFET is off (no charging or no supplement current).

When BATFET is removed, the system node VSYS is shorted to SRP. Before the converter starts operation, LDO mode needs to be disabled. The following sequence is required to configure charger without BATFET.

1. Before adapter plugs in, put the charger into HIZ mode. (either pull pin 6 ILIM\_HIZ to ground, or set

- REG0x32[15] to 1)
2. Set 0x12[2] to 0 to disable LDO mode.
  3. Set 0x30[0] to 0 to disable auto-wakeup mode.
  4. Check if battery voltage is properly programmed (REG0x15)
  5. Set pre-charge/charge current (REG0x14)
  6. Put the device out of HIZ mode. (Release ILIM\_HIZ from ground and set REG0x32[15]=0).

In order to prevent any accidental SW mistakes, the host sets low input current limit (a few hundred milliamps) when device is out of HIZ.

## 8.6.6 Input Current and Input Voltage Registers for Dynamic Power Management

The charger supports Dynamic Power Management (DPM). Normally, the input power source provides power for the system load or to charge the battery. When the input current exceeds the input current setting, or the input voltage falls below the input voltage setting, the charger decreases the charge current to provide priority to the system load. As the system current rises, the available charge current drops accordingly towards zero. If the system load keeps increasing after the charge current drops down to zero, the system voltage starts to drop. As the system voltage drops below the battery voltage, the battery will discharge to supply the heavy system load.

### 8.6.6.1 Input Current Registers

To set the maximum input current limit, write a 16-bit IIN\_HOST register command (REG0x3F()) using the data format listed in [表 31](#) and [表 32](#). When using a 10-mΩ sense resistor, the charger provides an input-current limit range of 50 mA to 6400 mA, with 50-mA resolution. The default current limit is 3.3 A. Due to the USB current setting requirement, the register setting specifies the maximum current instead of the typical current. Upon adapter removal, the input current limit is reset to the default value of 3.3 A. The register offset is 50 mA. With code 0, the input current limit is 50 mA.

The ACP and ACN pins are used to sense  $R_{AC}$  with the default value of 10 mΩ. For a 20-mΩ sense resistor, a larger sense voltage is given and a higher regulation accuracy, but at the expense of higher conduction loss.

Instead of using the internal DPM loop, the user can build up an external input current regulation loop and have the feedback signal on the ILIM\_HIZ pin.

$$V_{ILIM\_HIZ} = 1V + 40 \times (V_{ACP} - V_{ACN}) = 1 + 40 \times I_{DPM} \times R_{AC} \quad (2)$$

In order to disable ILIM\_HIZ pin, the host can write to 0x31[7] to disable ILIM\_HIZ pin, or pull ILIM\_HIZ pin above 4.0 V.

**8.6.6.1.1 IIN\_HOST Register With 10-mΩ Sense Resistor (SMBus address = 3Fh) [reset = 4000h]**

The register offset is 50 mA. With code 0, the input current limit readback is 50 mA.

**8.6.6.1.2 IIN\_DPM Register With 10-mΩ Sense Resistor (SMBus address = 022h) [reset = 0h]**

IIN\_DPM register reflects the actual input current limit programmed in the register, either from host or from ICO.

After ICO, the current limit used by DPM regulation may differ from the IIN\_HOST register settings. The actual DPM limit is reported in REG0x22(). The register offset is 50 mA. With code 0, the input current limit read-back is 50 mA.

**8.6.6.1.3 InputVoltage Register (SMBus address = 3Dh) [reset = VBUS-1.28V]**

To set the input voltage limit, write a 16-bit InputVoltage register command (REG0x3D()) using the data format listed in 表 35 and 表 36.

If the input voltage drops more than the InputVoltage register allows, the device enters DPM and reduces the charge current. The default offset voltage is 1.28 V below the no-load VBUS voltage. The DC offset is 3.2 V (0000000).

**图 31. InputVoltage Register (SMBus address = 3Dh) [reset = VBUS-1.28V]**

## 9 Application and Implementation

注

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

### 9.1 Application Information

The bq2570xEVM-732 evaluation module (EVM) is a complete charger module for evaluating the bq25700A. The application curves were taken using the bq2570xEVM-732. Refer to the EVM user's guide (SLUUBG6) for EVM information.

### 9.2 Typical Application

图 40. Application Diagram

#### 9.2.1 Design Requirements

| DESIGN PARAMETER                      | EXAMPLE VALUE                  |
|---------------------------------------|--------------------------------|
| Input Voltage <sup>(1)</sup>          | 3.5 V < Adapter Voltage < 24 V |
| Input Current Limit <sup>(1)</sup>    | 3.2 A for 65 W adapter         |
| Battery Charge Voltage <sup>(2)</sup> | 8400 mV for 2s battery         |

(1) Refer to adapter specification for settings for Input Voltage and Input Current Limit.

(2) Refer to battery specification for settings.

## Typical Application (接下页)

| DESIGN PARAMETER                      | EXAMPLE VALUE          |
|---------------------------------------|------------------------|
| Battery Charge Current <sup>(2)</sup> | 3072 mA for 2s battery |
| Minimum System Voltage <sup>(2)</sup> | 6144 mV for 2s battery |

### 9.2.2 Detailed Design Procedure

The parameters are configurable using the evaluation software. The simplified application circuit (see [图 40](#), as the application diagram) shows the minimum component requirements. Inductor, capacitor, and MOSFET selection are explained in the rest of this section. Refer to the EVM user's guide ([SLUUBG6](#)) for the complete application schematic.

#### 9.2.2.1 ACP-ACN Input Filter

The bq25700A has average current mode control. The input current sensing through ACP/ACN is critical to recover inductor current ripple. Parasitic inductance on board will generate high frequency ringing on ACP-ACN which overwhelms converter sensed inductor current information, so it is difficult to manage parasitic inductance created based on different PCB layout. Bigger parasitic inductance will generate bigger sense current ringing which will cause the average current control loop to go into oscillation.

For real system board condition, we suggest to use below circuit design to get best result and filter noise induced from different PCB parasitic factor. With time constant of filter from 47 nsec to 200 nsec, the filtering on ringing is effective and in the meantime, the delay of on the sensed signal is small and therefore poses no concern for average current mode control.

Copyright © 2017, Texas Instruments Incorporated

**图 41. ACN-ACP Input Filter**

#### 9.2.2.2 Inductor Selection

The bq25700A has two selectable fixed switching frequency. Higher switching frequency allows the use of smaller inductor and capacitor values. Inductor saturation current should be higher than the charging current ( $I_{CHG}$ ) plus half the ripple current ( $I_{RIPPLE}$ ):

$$I_{SAT} \geq I_{CHG} + (1/2) I_{RIPPLE} \quad (3)$$

The inductor ripple current in buck operation depends on input voltage ( $V_{IN}$ ), duty cycle ( $D_{BUCK} = V_{OUT}/V_{IN}$ ), switching frequency ( $f_s$ ) and inductance ( $L$ ):

$$I_{RIPPLE\_BUCK} = \frac{V_{IN} \times D \times (1 - D)}{f_s \times L} \quad (4)$$

During boost operation, the duty cycle is:

$$D_{\text{BOOST}} = 1 - (V_{\text{IN}}/V_{\text{BAT}})$$

and the ripple current is:

$$I_{\text{RIPPLE\_BOOST}} = (V_{\text{IN}} \times D_{\text{BOOST}}) / (f_{\text{S}} \times L)$$

The maximum inductor ripple current happens with  $D = 0.5$  or close to 0.5. For example, the battery charging voltage range is from 9 V to 12.6 V for 3-cell battery pack. For 20-V adapter voltage, 10-V battery voltage gives the maximum inductor ripple current. Another example is 4-cell battery, the battery voltage range is from 12 V to 16.8 V, and 12-V battery voltage gives the maximum inductor ripple current.

Usually inductor ripple is designed in the range of (20 – 40%) maximum charging current as a trade-off between inductor size and efficiency for a practical design.

### 9.2.2.3 Input Capacitor

Input capacitor should have enough ripple current rating to absorb input switching ripple current. The worst case RMS ripple current is half of the charging current when duty cycle is 0.5 in buck mode. If the converter does not operate at 50% duty cycle, then the worst case capacitor RMS current occurs where the duty cycle is closest to 50% and can be estimated by [公式 5](#):

$$I_{\text{CIN}} = I_{\text{CHG}} \times \sqrt{D \times (1 - D)} \quad (5)$$

Low ESR ceramic capacitor such as X7R or X5R is preferred for input decoupling capacitor and should be placed to the drain of the high side MOSFET and source of the low side MOSFET as close as possible. Voltage rating of the capacitor must be higher than normal input voltage level. 25 V rating or higher capacitor is preferred for 19 V - 20 V input voltage. Minimum 4 - 6 pcs of 10- $\mu\text{F}$  0805 size capacitor is suggested for 45 - 65 W adapter design.

Ceramic capacitors show a dc-bias effect. This effect reduces the effective capacitance when a dc-bias voltage is applied across a ceramic capacitor, as on the input capacitor of a charger. The effect may lead to a significant capacitance drop, especially for high input voltages and small capacitor packages. See the manufacturer's datasheet about the performance with a dc bias voltage applied. It may be necessary to choose a higher voltage rating or nominal capacitance value in order to get the required value at the operating point.

### 9.2.2.4 Output Capacitor

Output capacitor also should have enough ripple current rating to absorb output switching ripple current. In buck mode the output capacitor RMS current is given:

To get good loop stability, the resonant frequency of the output inductor and output capacitor should be designed between 10 kHz and 20 kHz. The preferred ceramic capacitor is 25-V X7R or X5R for output capacitor. Minimum 6 pcs of 10- $\mu\text{F}$  0805 size capacitor is suggested to be placed by the inductor. Place the capacitors after Q4 drain. Place minimum 10  $\mu\text{F}$  after the charge current sense resistor for best stability.

Ceramic capacitors show a dc-bias effect. This effect reduces the effective capacitance when a dc-bias voltage is applied across a ceramic capacitor, as on the output capacitor of a charger. The effect may lead to a significant capacitance drop, especially for high output voltages and small capacitor packages. See the manufacturer's data sheet about the performance with a dc bias voltage applied. It may be necessary to choose a higher voltage rating or nominal capacitance value in order to get the required value at the operating point.

### 9.2.2.5 Power MOSFETs Selection

Four external N-channel MOSFETs are used for a synchronous switching battery charger. The gate drivers are internally integrated into the IC with 6 V of gate drive voltage. 30 V or higher voltage rating MOSFETs are preferred for 19 V - 20 V input voltage.

Figure-of-merit (FOM) is usually used for selecting proper MOSFET based on a tradeoff between the conduction loss and switching loss. For the top side MOSFET, FOM is defined as the product of a MOSFET's on-resistance,  $R_{\text{DS(ON)}}$ , and the gate-to-drain charge,  $Q_{\text{GD}}$ . For the bottom side MOSFET, FOM is defined as the product of the MOSFET's on-resistance,  $R_{\text{DS(ON)}}$ , and the total gate charge,  $Q_{\text{G}}$ .

$$\text{FOM}_{\text{top}} = R_{\text{DS(on)}} \times Q_{\text{GD}}; \text{FOM}_{\text{bottom}} = R_{\text{DS(on)}} \times Q_{\text{G}} \quad (6)$$

The lower the FOM value, the lower the total power loss. Usually lower  $R_{\text{DS(ON)}}$  has higher cost with the same package size.

The top-side MOSFET loss includes conduction loss and switching loss. It is a function of duty cycle ( $D=V_{OUT}/V_{IN}$ ), charging current ( $I_{CHG}$ ), MOSFET's on-resistance ( $R_{DS(ON)}$ ), input voltage ( $V_{IN}$ ), switching frequency ( $f_s$ ), turn on time ( $t_{on}$ ) and turn off time ( $t_{off}$ ):

$$P_{top} = D \times I_{CHG}^2 \times R_{DS(on)} + \frac{1}{2} \times V_{IN} \times I_{CHG} \times (t_{on} + t_{off}) \times f_s \quad (7)$$

The first item represents the conduction loss. Usually MOSFET  $R_{DS(ON)}$  increases by 50% with 100°C junction temperature rise. The second term represents the switching loss. The MOSFET turn-on and turn-off times are given by:

$$t_{on} = \frac{Q_{SW}}{I_{on}}, \quad t_{off} = \frac{Q_{SW}}{I_{off}} \quad (8)$$

where  $Q_{SW}$  is the switching charge,  $I_{on}$  is the turn-on gate driving current and  $I_{off}$  is the turn-off gate driving current. If the switching charge is not given in MOSFET datasheet, it can be estimated by gate-to-drain charge ( $Q_{GD}$ ) and gate-to-source charge ( $Q_{GS}$ ):

$$Q_{SW} = Q_{GD} + \frac{1}{2} \times Q_{GS} \quad (9)$$

Gate driving current can be estimated by REGN voltage ( $V_{REGN}$ ), MOSFET plateau voltage ( $V_{plt}$ ), total turn-on gate resistance ( $R_{on}$ ) and turn-off gate resistance ( $R_{off}$ ) of the gate driver:

$$I_{on} = \frac{V_{REGN} - V_{plt}}{R_{on}}, \quad I_{off} = \frac{V_{plt}}{R_{off}} \quad (10)$$

The conduction loss of the bottom-side MOSFET is calculated with the following equation when it operates in synchronous continuous conduction mode:

$$P_{bottom} = (1 - D) \times I_{CHG}^2 \times R_{DS(on)} \quad (11)$$

When charger operates in non-synchronous mode, the bottom-side MOSFET is off. As a result all the freewheeling current goes through the body-diode of the bottom-side MOSFET. The body diode power loss depends on its forward voltage drop ( $V_F$ ), non-synchronous mode charging current ( $I_{NONSYN}$ ), and duty cycle ( $D$ ).

$$P_D = V_F \times I_{NONSYN} \times (1 - D) \quad (12)$$

The maximum charging current in non-synchronous mode can be up to 0.25 A for a 10-mΩ charging current sensing resistor or 0.5 A if battery voltage is below 2.5 V. The minimum duty cycle happens at lowest battery voltage. Choose the bottom-side MOSFET with either an internal Schottky or body diode capable of carrying the maximum non-synchronous mode charging current.

## 10 Power Supply Recommendations

The valid adapter range is from 3.5 V ( $V_{VBUS\_CONVEN}$ ) to 24 V (ACOV) with at least 500-mA current rating. When CHRG\_OK goes HIGH, the system is powered from adapter through the charger. When adapter is removed, the system is connected to battery through BATFET. Typically the battery depletion threshold should be greater than the minimum system voltage so that the battery capacity can be fully utilized for maximum battery life.

## 11 Layout

### 11.1 Layout Guidelines

The switching node rise and fall times should be minimized for minimum switching loss. Proper layout of the components to minimize high frequency current path loop (see [Layout Example](#) section) is important to prevent electrical and magnetic field radiation and high frequency resonant problems. Here is a PCB layout priority list for proper layout. Layout PCB according to this specific order is essential.

1. Place the input capacitor as close as possible to the supply of the switching MOSFET and ground connections. Use a short copper trace connection. These parts must be placed on the same layer of PCB using vias to make this connection.
2. The device must be placed close to the gate pins of the switching MOSFET. Keep the gate drive signal traces short for a clean MOSFET drive. The device can be placed on the other side of the PCB of switching MOSFETs.
3. Place an inductor input pin as close as possible to the output pin of the switching MOSFET. Minimize the copper area of this trace to lower electrical and magnetic field radiation but make the trace wide enough to carry the charging current. Do not use multiple layers in parallel for this connection. Minimize parasitic capacitance from this area to any other trace or plane.
4. The charging current sensing resistor should be placed right next to the inductor output. Route the sense leads connected across the sensing resistor back to the device in same layer, close to each other (minimize loop area) and do not route the sense leads through a high-current path (see [图 60](#) for Kelvin connection for best current accuracy). Place a decoupling capacitor on these traces next to the device.
5. Place an output capacitor next to the sensing resistor output and ground.
6. Output capacitor ground connections must be tied to the same copper that connects to the input capacitor ground before connecting to system ground.
7. Use a single ground connection to tie the charger power ground to the charger analog ground. Just beneath the device, use analog ground copper pour but avoid power pins to reduce inductive and capacitive noise coupling.
8. Route analog ground separately from power ground. Connect analog ground and connect power ground separately. Connect analog ground and power ground together using power pad as the single ground connection point. Or using a 0-Ω resistor to tie analog ground to power ground (power pad should tie to analog ground in this case if possible).
9. Decoupling capacitors must be placed next to the device pins. Make trace connection as short as possible.
10. It is critical that the exposed power pad on the backside of the device package be soldered to the PCB ground.
11. The via size and number should be enough for a given current path. See the EVM design ([SLUUBG6](#)) for the recommended component placement with trace and via locations. For WQFN information, see [SLUA271](#).

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

**RoHS Exempt:** TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

**Green:** TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

**Important Information and Disclaimer:**The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

## TAPE AND REEL INFORMATION

### QUADRANT ASSIGNMENTS FOR PIN 1 ORIENTATION IN TAPE

\*All dimensions are nominal

| Device       | Package Type | Package Drawing | Pins | SPQ  | Reel Diameter (mm) | Reel Width W1 (mm) | A0 (mm) | B0 (mm) | K0 (mm) | P1 (mm) | W (mm) | Pin1 Quadrant |
|--------------|--------------|-----------------|------|------|--------------------|--------------------|---------|---------|---------|---------|--------|---------------|
| BQ25700ARSNR | QFN          | RSN             | 32   | 3000 | 330.0              | 12.4               | 4.25    | 4.25    | 1.15    | 8.0     | 12.0   | Q2            |
| BQ25700ARSNT | QFN          | RSN             | 32   | 250  | 180.0              | 12.4               | 4.25    | 4.25    | 1.15    | 8.0     | 12.0   | Q2            |

TAPE AND REEL BOX DIMENSIONS

\*All dimensions are nominal

| Device       | Package Type | Package Drawing | Pins | SPQ  | Length (mm) | Width (mm) | Height (mm) |
|--------------|--------------|-----------------|------|------|-------------|------------|-------------|
| BQ25700ARSNR | QFN          | RSN             | 32   | 3000 | 367.0       | 367.0      | 35.0        |
| BQ25700ARSNT | QFN          | RSN             | 32   | 250  | 210.0       | 185.0      | 35.0        |

RSN (S-PWQFN-N32)

PLASTIC QUAD FLATPACK NO-LEAD

4207561/C 08/11

- NOTES:
- All linear dimensions are in millimeters. Dimensioning and tolerancing per ASME Y14.5M-1994.
  - This drawing is subject to change without notice.
  - QFN (Quad Flatpack No-Lead) Package configuration.
  - The package thermal pad must be soldered to the board for thermal and mechanical performance.
  - See the additional figure in the Product Data Sheet for details regarding the exposed thermal pad features and dimensions.

# THERMAL PAD MECHANICAL DATA

RSN (S-PWQFN-N32)

PLASTIC QUAD FLATPACK NO-LEAD

## THERMAL INFORMATION

This package incorporates an exposed thermal pad that is designed to be attached directly to an external heatsink. The thermal pad must be soldered directly to the printed circuit board (PCB). After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For information on the Quad Flatpack No-Lead (QFN) package and its advantages, refer to Application Report, QFN/SON PCB Attachment, Texas Instruments Literature No. SLUA271. This document is available at [www.ti.com](http://www.ti.com).

The exposed thermal pad dimensions for this package are shown in the following illustration.

Bottom View

Exposed Thermal Pad Dimensions

4209775-2/F 03/14

NOTE: All linear dimensions are in millimeters

RSN (S-PWQFN-N32)

PLASTIC QUAD FLATPACK NO-LEAD

- NOTES:
- All linear dimensions are in millimeters.
  - This drawing is subject to change without notice.
  - Publication IPC-7351 is recommended for alternate designs.
  - This package is designed to be soldered to a thermal pad on the board. Refer to Application Note, Quad Flat-Pack Packages, Texas Instruments Literature No. SLUA271, and also the Product Data Sheets for specific thermal information, via requirements, and recommended board layout. These documents are available at [www.ti.com](http://www.ti.com) <<http://www.ti.com>>.
  - Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC 7525 for stencil design considerations.
  - Customers should contact their board fabrication site for recommended solder mask tolerances and via tenting recommendations for vias placed in the thermal pad.

## 重要声明和免责声明

TI 提供技术和可靠性数据（包括数据表）、设计资源（包括参考设计）、应用或其他设计建议、网络工具、安全信息和其他资源，不保证没有瑕疵且不做任何明示或暗示的担保，包括但不限于对适销性、某特定用途方面的适用性或不侵犯任何第三方知识产权的暗示担保。

这些资源可供使用 TI 产品进行设计的熟练开发人员使用。您将自行承担以下全部责任：(1) 针对您的应用选择合适的 TI 产品，(2) 设计、验证并测试您的应用，(3) 确保您的应用满足相应标准以及任何其他安全、安保或其他要求。这些资源如有变更，恕不另行通知。TI 授权您仅可将这些资源用于研发本资源所述的 TI 产品的应用。严禁对这些资源进行其他复制或展示。您无权使用任何其他 TI 知识产权或任何第三方知识产权。您应全额赔偿因在这些资源的使用中对 TI 及其代表造成的任何索赔、损害、成本、损失和债务，TI 对此概不负责。
