

# INA199 26-V, Bidirectional, Zero-Drift, Low- or High-Side, Voltage-Output, Current-Shunt Monitor

## 1 Features

- Wide Common-Mode Range:  $-0.3\text{ V}$  to  $26\text{ V}$
- Offset Voltage:  $\pm 150\ \mu\text{V}$  (Maximum)  
(Enables Shunt Drops of 10-mV Full-Scale)
- Accuracy:
  - Gain Error (Maximum Over Temperature):
    - $\pm 1\%$  (C Version)
    - $\pm 1.5\%$  (A and B Versions)
  - $0.5\text{-}\mu\text{V}/^\circ\text{C}$  Offset Drift (Maximum)
  - $10\text{-ppm}/^\circ\text{C}$  Gain Drift (Maximum)
- Choice of Gains:
  - INA199x1: 50 V/V
  - INA199x2: 100 V/V
  - INA199x3: 200 V/V
- Quiescent Current:  $100\ \mu\text{A}$  (Maximum)
- Packages: 6-Pin SC70, 10-Pin UQFN

## 2 Applications

- Notebook Computers
- Cell Phones
- Qi-Compliant Wireless Charging Transmitters
- Telecom Equipment
- Power Management
- Battery Chargers

## 3 Description

The INA199 series of voltage-output, current-shunt monitors (also called current-sense amplifiers) are commonly used for overcurrent protection, precision-current measurement for system optimization, or in closed-loop feedback circuits. This series of devices can sense drops across shunt resistors at common-mode voltages from  $-0.3\text{ V}$  to  $26\text{ V}$ , independent of the supply voltage. Three fixed gains are available: 50 V/V, 100 V/V, and 200 V/V. The low offset of the zero-drift architecture enables current sensing with maximum drops across the shunt as low as 10-mV full-scale.

These devices operate from a single 2.7-V to 26-V power supply, drawing a maximum of  $100\ \mu\text{A}$  of supply current. All versions are specified from  $-40^\circ\text{C}$  to  $125^\circ\text{C}$ , and offered in both SC70-6 and thin UQFN-10 packages.

### Device Information

PART NUMBER	PACKAGE <sup>(1)</sup>	BODY SIZE (NOM)
INA199	SC70 (6)	2.00 mm × 1.25 mm
	UQFN (10)	1.80 mm × 1.40 mm

(1) For all available packages, see the orderable addendum at the end of the data sheet.

**Figure 5-2. RSW Package 10-Pin UQFN Top View**

A. NC<sup>(1)</sup> denotes no internal connection. These pins can be left floating or connected to any voltage between GND and V+.

**Table 5-1. Pin Functions**

NAME	PIN		I/O	DESCRIPTION
	SC70	UQFN		
GND	2	9	Analog	Ground
IN-	5	4, 5	Analog input	Connect to load side of shunt resistor.
IN+	4	2, 3	Analog input	Connect to supply side of shunt resistor.
NC	—	1, 7	—	Not internally connected. Leave floating or connect to ground.
OUT	6	10	Analog output	Output voltage
REF	1	8	Analog input	Reference voltage, 0 V to V+
V+	3	6	Analog	Power supply, 2.7 V to 26 V

## 6 Specifications

### 6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)<sup>(1)</sup>

		MIN	MAX	UNIT
Supply voltage			26	V
Analog inputs, $V_{IN+}$ , $V_{IN-}$ <sup>(2)</sup>	Differential ( $V_{IN+}$ ) – ( $V_{IN-}$ )	–26	26	V
	Common-mode <sup>(3)</sup> , INA199Ax	GND – 0.3	26	
	Common-mode <sup>(3)</sup> , INA199Bx and INA199Cx	GND – 0.1	26	
REF input		GND – 0.3	(V+) + 0.3	V
Output <sup>(3)</sup>		GND – 0.3	(V+) + 0.3	V
Input current into all pins <sup>(3)</sup>			5	mA
Operating temperature		–40	125	°C
Junction temperature			150	°C
Storage temperature, $T_{stg}$		–65	150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2)  $V_{IN+}$  and  $V_{IN-}$  are the voltages at the IN+ and IN– pins, respectively.
- (3) Input voltage at any pin cannot exceed the voltage shown if the current at that pin is limited to 5 mA.

### 6.2 ESD Ratings

			VALUE	UNIT
INA199A1, INA199A2, and INA199A3 in DCK and RSW Packages				
$V_{(ESD)}$	Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 <sup>(1)</sup>	±2000	V
		Charged-device model (CDM), per JEDEC specification JESD22-C101 <sup>(2)</sup>	±1000	
INA199Bx and INA199Cx in DCK and RSW Packages				
$V_{(ESD)}$	Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 <sup>(1)</sup>	±3500	V
		Charged-device model (CDM), per JEDEC specification JESD22-C101 <sup>(2)</sup>	±1000	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

### 6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
$V_{CM}$	Common-mode input voltage		12		V
$V_S$	Operating supply voltage (applied to V+)		5		V
$T_A$	Operating free-air temperature	-40		125	°C

### 6.4 Thermal Information

THERMAL METRIC <sup>(1)</sup>	INA199		UNIT	
	DCK (SC70)	RSW (UQFN)		
	6 PINS	10 PINS		
$R_{\theta JA}$	Junction-to-ambient thermal resistance	227.3	107.3	°C/W
$R_{\theta JC(top)}$	Junction-to-case (top) thermal resistance	79.5	56.5	°C/W
$R_{\theta JB}$	Junction-to-board thermal resistance	72.1	18.7	°C/W
$\Psi_{JT}$	Junction-to-top characterization parameter	3.6	1.1	°C/W
$\Psi_{JB}$	Junction-to-board characterization parameter	70.4	18.7	°C/W
$R_{\theta JC(bot)}$	Junction-to-case (bottom) thermal resistance	—	—	°C/W

- (1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application report.

## 6.5 Electrical Characteristics

at  $T_A = 25^\circ\text{C}$ ,  $V_S = 5\text{ V}$ ,  $V_{IN+} = 12\text{ V}$ ,  $V_{SENSE} = V_{IN+} - V_{IN-}$ , and  $V_{REF} = V_S / 2$  (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
<b>INPUT</b>						
$V_{CM}$	Common-mode input range	Version A, $T_A = -40^\circ\text{C}$ to $125^\circ\text{C}$	-0.3		26	V
		Version B and C, $T_A = -40^\circ\text{C}$ to $125^\circ\text{C}$	-0.1		26	
CMR	Common-mode rejection	$V_{IN+} = 0\text{ V}$ to $26\text{ V}$ , $V_{SENSE} = 0\text{ mV}$ , $T_A = -40^\circ\text{C}$ to $125^\circ\text{C}$	100	120		dB
$V_{OS}$	Offset voltage, RTI <sup>(1)</sup>	$V_{SENSE} = 0\text{ mV}$		$\pm 5$	$\pm 150$	$\mu\text{V}$
$dV_{OS}/dT$	$V_{OS}$ vs temperature	$T_A = -40^\circ\text{C}$ to $125^\circ\text{C}$		0.1	0.5	$\mu\text{V}/^\circ\text{C}$
PSR	Power supply rejection	$V_S = 2.7\text{ V}$ to $18\text{ V}$ , $V_{IN+} = 18\text{ V}$ , $V_{SENSE} = 0\text{ mV}$		$\pm 0.1$		$\mu\text{V}/\text{V}$
$I_B$	Input bias current	$V_{SENSE} = 0\text{ mV}$		28		$\mu\text{A}$

## 7 Detailed Description

### 7.1 Overview

The INA199 is a 26-V common mode, zero-drift topology, current-sensing amplifier that can be used in both low-side and high-side configurations. The device is a specially-designed, current-sensing amplifier that is able to accurately measure voltages developed across a current-sensing resistor on common-mode voltages that far exceed the supply voltage powering the device. Current can be measured on input voltage rails as high as 26 V and the device can be powered from supply voltages as low as 2.7 V.

The zero-drift topology enables high-precision measurements with maximum input offset voltages as low as 150  $\mu\text{V}$  with a maximum temperature contribution of 0.5  $\mu\text{V}/^\circ\text{C}$  over the full temperature range of  $-40^\circ\text{C}$  to  $+125^\circ\text{C}$ .

### 7.2 Functional Block Diagram

## 7.3 Feature Description

### 7.3.1 Basic Connections

Figure 7-1 shows the basic connections for the INA199. The input pins, IN+ and IN–, must be connected as close as possible to the shunt resistor to minimize any resistance in series with the shunt resistor.

Copyright © 2017, Texas Instruments Incorporated

**Figure 7-1. Typical Application**

Power-supply bypass capacitors are required for stability. Applications with noisy or high-impedance power supplies may require additional decoupling capacitors to reject power-supply noise. Connect bypass capacitors close to the device pins.

On the RSW package, two pins are provided for each input. These pins must be tied together (that is, tie IN+ to IN+ and tie IN– to IN–).

### 7.3.2 Selecting $R_S$

The zero-drift offset performance of the INA199 offers several benefits. Most often, the primary advantage of the low offset characteristic enables lower full-scale drops across the shunt. For example, non-zero-drift current shunt monitors typically require a full-scale range of 100 mV.

The INA199 series gives equivalent accuracy at a full-scale range on the order of 10 mV. This accuracy reduces shunt dissipation by an order of magnitude with many additional benefits.

Alternatively, there are applications that must measure current over a wide dynamic range that can take advantage of the low offset on the low end of the measurement. Most often, these applications can use the lower gain of 50 or 100 to accommodate larger shunt drops on the upper end of the scale. For instance, an INA199A1 operating on a 3.3-V supply can easily handle a full-scale shunt drop of 60 mV, with only 150  $\mu$ V of offset.

## 7.4 Device Functional Modes

### 7.4.1 Input Filtering

An obvious and straightforward filtering location is at the device output. However, this location negates the advantage of the low output impedance of the internal buffer. The only other filtering option is at the device input pins. This location, though, does require consideration of the  $\pm 30\%$  tolerance of the internal resistances. Figure 7-2 shows a filter placed at the inputs pins.

Figure 7-2. Filter at Input Pins

The addition of external series resistance, however, creates an additional error in the measurement so the value of these series resistors must be kept to  $10\ \Omega$  (or less if possible) to reduce any affect to accuracy. The internal bias network shown in Figure 7-2 present at the input pins creates a mismatch in input bias currents when a differential voltage is applied between the input pins. If additional external series filter resistors are added to the circuit, the mismatch in bias currents results in a mismatch of voltage drops across the filter resistors. This mismatch creates a differential error voltage that subtracts from the voltage developed at the shunt resistor. This error results in a voltage at the device input pins that is different than the voltage developed across the shunt resistor. Without the additional series resistance, the mismatch in input bias currents has little effect on device operation. The amount of error these external filter resistor add to the measurement can be calculated using Equation 2 where the gain error factor is calculated using Equation 1.

The amount of variance in the differential voltage present at the device input relative to the voltage developed at the shunt resistor is based both on the external series resistance value as well as the internal input resistors,  $R_3$  and  $R_4$  (or  $R_{INT}$  as shown in Figure 7-2). The reduction of the shunt voltage reaching the device input pins appears as a gain error when comparing the output voltage relative to the voltage across the shunt resistor. A factor can be calculated to determine the amount of gain error that is introduced by the addition of external series resistance. The equation used to calculate the expected deviation from the shunt voltage to what is seen at the device input pins is given in Equation 1:

$$\text{Gain Error Factor} = \frac{(1250 \times R_{INT})}{(1250 \times R_S) + (1250 \times R_{INT}) + (R_S \times R_{INT})} \quad (1)$$

where:

- $R_{INT}$  is the internal input resistor ( $R_3$  and  $R_4$ ).
- $R_S$  is the external series resistance.

With the adjustment factor equation including the device internal input resistance, this factor varies with each gain version, as listed in [Table 7-1](#). Each individual device gain error factor is listed in [Table 7-2](#).

**Table 7-1. Input Resistance**

PRODUCT	GAIN	R <sub>INT</sub> (kΩ)
INA199x1	50	20
INA199x2	100	10
INA199x3	200	5

**Table 7-2. Device Gain Error Factor**

PRODUCT	SIMPLIFIED GAIN ERROR FACTOR
INA199x1	$\frac{20,000}{(17 \times R_S) + 20,000}$
INA199x2	$\frac{10,000}{(9 \times R_S) + 10,000}$
INA199x3	$\frac{1000}{R_S + 1000}$

The gain error that can be expected from the addition of the external series resistors can then be calculated based on [Equation 2](#):

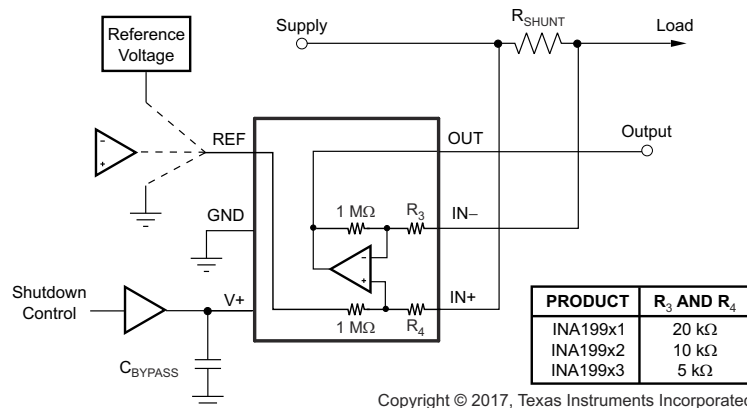

$$\text{Gain Error (\%)} = 100 - (100 \times \text{Gain Error Factor}) \tag{2}$$

For example, using an INA199x2 and the corresponding gain error equation from [Table 7-2](#), a series resistance of 10-Ω results in a gain error factor of 0.991. The corresponding gain error is then calculated using [Equation 2](#), resulting in a gain error of approximately 0.89% solely because of the external 10-Ω series resistors. Using an INA199x1 with the same 10-Ω series resistor results in a gain error factor of 0.991 and a gain error of 0.84% again solely because of these external resistors.

**7.4.2 Shutting Down the INA199 Series**

Although the INA199 series does not have a shutdown pin, the low power consumption of the device allows the output of a logic gate or transistor switch to power the INA199. This gate or switch turns on and turns off the INA199 power-supply quiescent current.

However, in current shunt monitoring applications, there is also a concern for how much current is drained from the shunt circuit in shutdown conditions. Evaluating this current drain involves considering the simplified schematic of the INA199 in shutdown mode shown in [Figure 7-3](#).

1-MΩ paths from shunt inputs to reference and the INA199 outputs.

**Figure 7-3. Basic Circuit for Shutting Down the INA199 With a Grounded Reference**

There is typically slightly more than 1-M $\Omega$  impedance (from the combination of 1-M $\Omega$  feedback and 5-k $\Omega$  input resistors) from each input of the INA199 to the OUT pin and to the REF pin. The amount of current flowing through these pins depends on the respective ultimate connection. For example, if the REF pin is grounded, the calculation of the effect of the 1-M $\Omega$  impedance from the shunt to ground is straightforward. However, if the reference or operational amplifier is powered when the INA199 is shut down, the calculation is direct; instead of assuming 1-M $\Omega$  to ground, however, assume 1-M $\Omega$  to the reference voltage. If the reference or operational amplifier is also shut down, some knowledge of the reference or operational amplifier output impedance under shutdown conditions is required. For instance, if the reference source functions as an open circuit when not powered, little or no current flows through the 1-M $\Omega$  path.

Regarding the 1-M $\Omega$  path to the output pin, the output stage of a disabled INA199 does constitute a good path to ground. Consequently, this current is directly proportional to a shunt common-mode voltage impressed across a 1-M $\Omega$  resistor.

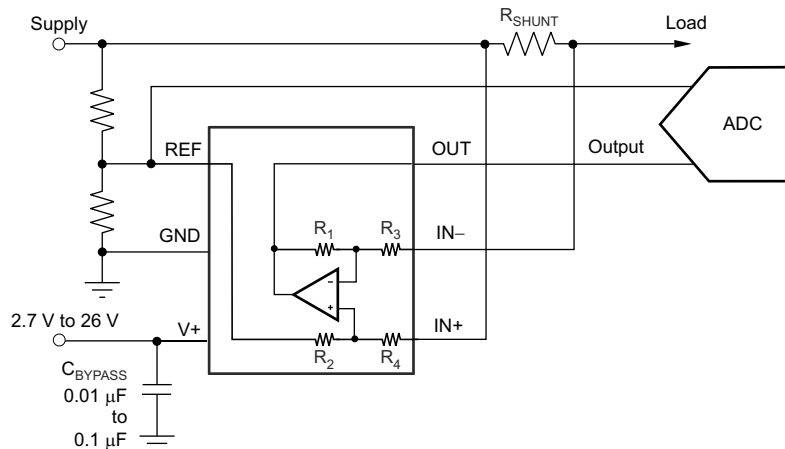

**Note**

When the device is powered up, there is an additional, nearly constant, and well-matched 25  $\mu$ A that flows in each of the inputs as long as the shunt common-mode voltage is 3 V or higher. Below 2-V common-mode, the only current effects are the result of the 1-M $\Omega$  resistors.

**7.4.3 REF Input Impedance Effects**

As with any difference amplifier, the INA199 series common-mode rejection ratio is affected by any impedance present at the REF input. This concern is not a problem when the REF pin is connected directly to most references or power supplies. When using resistive dividers from the power supply or a reference voltage, the REF pin must be buffered by an operational amplifier.

In systems where the INA199 output can be sensed differentially, such as by a differential input analog-to-digital converter (ADC) or by using two separate ADC inputs, the effects of external impedance on the REF input can be cancelled. [Figure 7-4](#) depicts a method of taking the output from the INA199 by using the REF pin as a reference.

**Figure 7-4. Sensing the INA199 to Cancel Effects of Impedance on the REF Input**

**7.4.4 Using the INA199 With Common-Mode Transients Above 26 V**

With a small amount of additional circuitry, the INA199 series can be used in circuits subject to transients higher than 26 V, such as automotive applications. Use only Zener diode or Zener-type transient absorbers (sometimes referred to as *transzorbs*); any other type of transient absorber has an unacceptable time delay. Start by adding a pair of resistors (see [Figure 7-5](#)) as a working impedance for the Zener. Keeping these resistors as small as possible is preferable, most often approximately 10  $\Omega$ . Larger values can be used with an effect on gain as discussed in the [Section 7.4.1](#) section. Because this circuit limits only short-term transients, many applications

are satisfied with a 10-Ω resistor along with conventional Zener diodes of the lowest power rating that can be found. This combination uses the least amount of board space. These diodes can be found in packages as small as SOT-523 or SOD-523. See *TIDA-00302 Transient Robustness for Current Shunt Monitor Design Guide*, [TIDU473](#) for more information on transient robustness and current-shunt monitor input protection.

**Figure 7-5. INA199 Transient Protection Using Dual Zener Diodes**

In the event that low-power zeners do not have sufficient transient absorption capability and a higher power tranzorb must be used, the most package-efficient solution then involves using a single tranzorb and back-to-back diodes between the device inputs. The most space-efficient solutions are dual series-connected diodes in a single SOT-523 or SOD-523 package. This method is shown in [Figure 7-6](#). In either of these examples, the total board area required by the INA199 with all protective components is less than that of an SO-8 package, and only slightly greater than that of an MSOP-8 package.

**Figure 7-6. INA199 Transient Protection Using a Single Tranzorb and Input Clamps**

### 7.4.5 Improving Transient Robustness

Applications involving large input transients with excessive  $dV/dt$  above 2 kV per microsecond present at the device input pins can cause damage to the internal ESD structures on version A devices. This potential damage is a result of the internal latching of the ESD structure to ground when this transient occurs at the input. With significant current available in most current-sensing applications, the large current flowing through the input transient-triggered, ground-shorted ESD structure quickly results in damage to the silicon. External filtering can be used to attenuate the transient signal prior to reaching the inputs to avoid the latching condition. Take care to ensure that external series input resistance does not significantly affect gain error accuracy. For accuracy purposes, keep the resistance under  $10\ \Omega$  if possible. Ferrite beads are recommended for this filter because of their inherently low dc ohmic value. Ferrite beads with less than  $10\ \Omega$  of resistance at dc and over  $600\ \Omega$  of resistance at 100 MHz to 200 MHz are recommended. The recommended capacitor values for this filter are between  $0.01\ \mu\text{F}$  and  $0.1\ \mu\text{F}$  to ensure adequate attenuation in the high-frequency region. This protection scheme is shown in Figure 7-7. Again, see *TIDA-00302 Transient Robustness for Current Shunt Monitor Design Guide*, [TIDU473](#) for more information on transient robustness and current-shunt monitor input protection.

**Figure 7-7. Transient Protection**

To minimize the cost of adding these external components to protect the device in applications where large transient signals may be present, version B and C devices are now available with new ESD structures that are not susceptible to this latching condition. Version B and C devices are incapable of sustaining these damage-causing latched conditions so these devices do not have the same sensitivity to the transients that the version A devices have, thus making the version B and C devices a better fit for these applications.

## 8 Application and Implementation

### Note

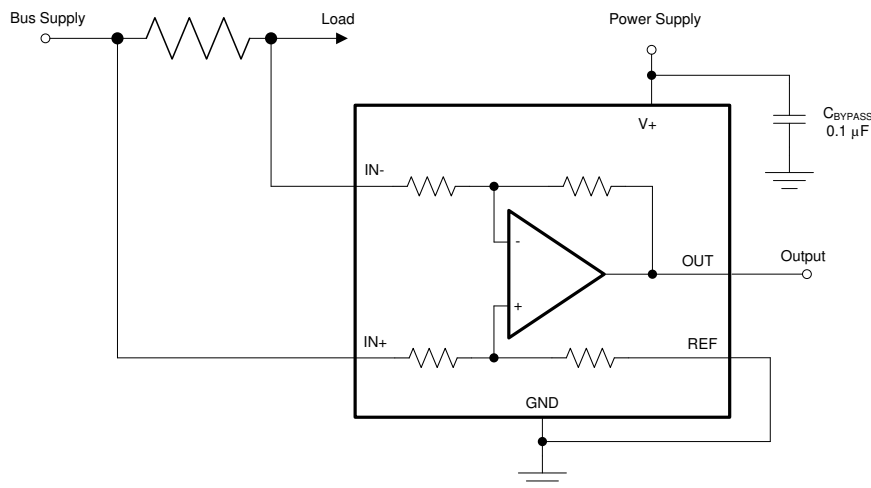

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes, as well as validating and testing their design implementation to confirm system functionality.

### 8.1 Application Information

The INA199 measures the voltage developed across a current-sensing resistor when current passes through it. The ability to drive the reference pin to adjust the functionality of the output signal offers multiple configurations, as discussed throughout this section.

### 8.2 Typical Applications

#### 8.2.1 Unidirectional Operation

Copyright © 2017, Texas Instruments Incorporated

**Figure 8-1. Unidirectional Application Schematic**

##### 8.2.1.1 Design Requirements

The device can be configured to monitor current flowing in one direction (unidirectional) or in both directions (bidirectional) depending on how the REF pin is configured. The most common case is unidirectional where the output is set to ground when no current is flowing by connecting the REF pin to ground, as shown in [Figure 8-1](#). When the input signal increases, the output voltage at the OUT pin increases.

##### 8.2.1.2 Detailed Design Procedure

The linear range of the output stage is limited in how close the output voltage can approach ground under zero input conditions. In unidirectional applications where measuring very low input currents is desirable, bias the REF pin to a convenient value above 50 mV to get the output into the linear range of the device. To limit common-mode rejection errors, TI recommends buffering the reference voltage connected to the REF pin.

A less frequently-used output biasing method is to connect the REF pin to the supply voltage, V+. This method results in the output voltage saturating at 200 mV below the supply voltage when no differential input signal is present. This method is similar to the output saturated low condition with no input signal when the REF pin is connected to ground. The output voltage in this configuration only responds to negative currents that develop negative differential input voltage relative to the device IN- pin. Under these conditions, when the differential

input signal increases negatively, the output voltage moves downward from the saturated supply voltage. The voltage applied to the REF pin must not exceed the device supply voltage.

### 8.2.1.3 Application Curve

An example output response of a unidirectional configuration is shown in Figure 8-2. With the REF pin connected directly to ground, the output voltage is biased to this zero output level. The output rises above the reference voltage for positive differential input signals but cannot fall below the reference voltage for negative differential input signals because of the grounded reference voltage.

**Figure 8-2. Unidirectional Application Output Response**

## 8.2.2 Bidirectional Operation

Copyright © 2017, Texas Instruments Incorporated

**Figure 8-3. Bidirectional Application Schematic**

### 8.2.2.1 Design Requirements

The device is a bidirectional, current-sense amplifier capable of measuring currents through a resistive shunt in two directions. This bidirectional monitoring is common in applications that include charging and discharging operations where the current flow-through resistor can change directions.

### 8.2.2.2 Detailed Design Procedure

The ability to measure this current flowing in both directions is enabled by applying a voltage to the REF pin; see Figure 8-3. The voltage applied to REF ( $V_{REF}$ ) sets the output state that corresponds to the zero-input level

state. The output then responds by increasing above  $V_{REF}$  for positive differential signals (relative to the  $IN-$  pin) and responds by decreasing below  $V_{REF}$  for negative differential signals. This reference voltage applied to the REF pin can be set anywhere between 0 V to  $V+$ . For bidirectional applications,  $V_{REF}$  is typically set at mid-scale for equal signal range in both current directions. In some cases, however,  $V_{REF}$  is set at a voltage other than mid-scale when the bidirectional current and corresponding output signal do not need to be symmetrical.

### 8.2.2.3 Application Curve

Figure 8-4. Bidirectional Application Output Response

## 9 Power Supply Recommendations

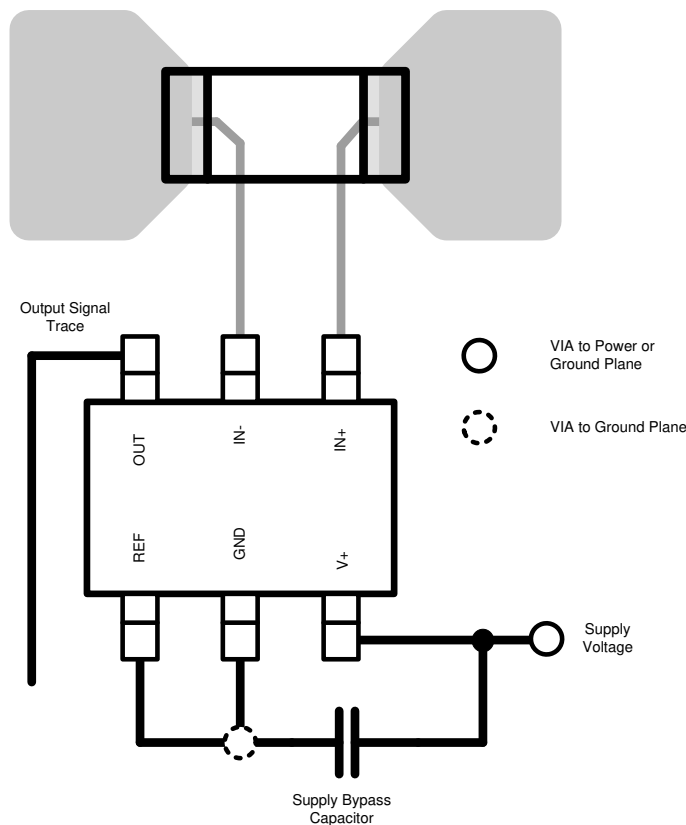

The input circuitry of the INA199 can accurately measure beyond its power-supply voltage,  $V+$ . For example, the  $V+$  power supply can be 5 V, whereas the load power-supply voltage can be as high as 26 V. However, the output voltage range of the OUT pin is limited by the voltages on the power-supply pin. Also, the INA199 can withstand the full input signal range up to 26-V range in the input pins, regardless of whether the device has power applied or not.

## 10 Layout

### 10.1 Layout Guidelines

- Connect the input pins to the sensing resistor using a kelvin or 4-wire connection. This connection technique ensures that only the current-sensing resistor impedance is detected between the input pins. Poor routing of the current-sensing resistor commonly results in additional resistance present between the input pins. Given the very low ohmic value of the current resistor, any additional high-current carrying impedance can cause significant measurement errors.
- Place the power-supply bypass capacitor as close as possible to the supply and ground pins. TI recommends using a bypass capacitor with a value of 0.1  $\mu\text{F}$ . Additional decoupling capacitance can be added to compensate for noisy or high-impedance power supplies.

### 10.2 Layout Example

## 11 Device and Documentation Support

### 11.1 Documentation Support

#### 11.1.1 Related Documentation

For related documentation see the following:

- [INA199A1-A3EVM User's Guide](#)
- [TIDA-00302 Transient Robustness for Current Shunt Monitor](#)

### 11.2 Receiving Notification of Documentation Updates

To receive notification of documentation updates, navigate to the device product folder on [ti.com](http://ti.com). Click on *Notifications* to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

### 11.3 Support Resources

[TI E2E™ support forums](#) are an engineer's go-to source for fast, verified answers and design help — straight from the experts. Search existing answers or ask your own question to get the quick design help you need.

Linked content is provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's [Terms of Use](#).

### 11.4 Trademarks

TI E2E™ is a trademark of Texas Instruments.

All trademarks are the property of their respective owners.

### 11.5 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

### 11.6 Glossary

[TI Glossary](#) This glossary lists and explains terms, acronyms, and definitions.

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

**RoHS Exempt:** TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

**Green:** TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

**Important Information and Disclaimer:**The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

RSW0010A

PACKAGE OUTLINE

UQFN - 0.55 mm max height

PLASTIC QUAD FLATPACK - NO LEAD

4224897/A 03/2019

NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. This package complies to JEDEC MO-288 variation UDEE, except minimum package height.

# EXAMPLE BOARD LAYOUT

RSW0010A

UQFN - 0.55 mm max height

PLASTIC QUAD FLATPACK - NO LEAD

LAND PATTERN EXAMPLE  
EXPOSED METAL SHOWN  
SCALE: 30X

4224897/A 03/2019

NOTES: (continued)

- This package is designed to be soldered to a thermal pad on the board. For more information, see Texas Instruments literature number SLUA271 ([www.ti.com/lit/sluea271](http://www.ti.com/lit/sluea271)).
- Vias are optional depending on application, refer to device data sheet. If any vias are implemented, refer to their locations shown on this view. It is recommended that vias under paste be filled, plugged or tented.

# EXAMPLE STENCIL DESIGN

RSW0010A

UQFN - 0.55 mm max height

PLASTIC QUAD FLATPACK - NO LEAD

SOLDER PASTE EXAMPLE  
BASED ON 0.125 MM THICK STENCIL  
SCALE: 30X

4224897/A 03/2019

NOTES: (continued)

6. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.

DCK (R-PDSO-G6)

PLASTIC SMALL-OUTLINE PACKAGE

- NOTES:
- A. All linear dimensions are in millimeters.
  - B. This drawing is subject to change without notice.
  - C. Body dimensions do not include mold flash or protrusion. Mold flash and protrusion shall not exceed 0.15 per side.
  - D. Falls within JEDEC MO-203 variation AB.

DCK (R-PDSO-G6)

PLASTIC SMALL OUTLINE

- NOTES:
- A. All linear dimensions are in millimeters.
  - B. This drawing is subject to change without notice.
  - C. Customers should place a note on the circuit board fabrication drawing not to alter the center solder mask defined pad.
  - D. Publication IPC-7351 is recommended for alternate designs.
  - E. Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Example stencil design based on a 50% volumetric metal load solder paste. Refer to IPC-7525 for other stencil recommendations.

## IMPORTANT NOTICE AND DISCLAIMER

TI PROVIDES TECHNICAL AND RELIABILITY DATA (INCLUDING DATA SHEETS), DESIGN RESOURCES (INCLUDING REFERENCE DESIGNS), APPLICATION OR OTHER DESIGN ADVICE, WEB TOOLS, SAFETY INFORMATION, AND OTHER RESOURCES "AS IS" AND WITH ALL FAULTS, AND DISCLAIMS ALL WARRANTIES, EXPRESS AND IMPLIED, INCLUDING WITHOUT LIMITATION ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE OR NON-INFRINGEMENT OF THIRD PARTY INTELLECTUAL PROPERTY RIGHTS.

These resources are intended for skilled developers designing with TI products. You are solely responsible for (1) selecting the appropriate TI products for your application, (2) designing, validating and testing your application, and (3) ensuring your application meets applicable standards, and any other safety, security, regulatory or other requirements.

These resources are subject to change without notice. TI grants you permission to use these resources only for development of an application that uses the TI products described in the resource. Other reproduction and display of these resources is prohibited. No license is granted to any other TI intellectual property right or to any third party intellectual property right. TI disclaims responsibility for, and you will fully indemnify TI and its representatives against, any claims, damages, costs, losses, and liabilities arising out of your use of these resources.

TI's products are provided subject to [TI's Terms of Sale](#) or other applicable terms available either on [ti.com](https://www.ti.com) or provided in conjunction with such TI products. TI's provision of these resources does not expand or otherwise alter TI's applicable warranties or warranty disclaimers for TI products.

TI objects to and rejects any additional or different terms you may have proposed.
